East Coast Transistor, http://www.kenwoodparts.com/ , has all 4 parts listed as available. Spot checks to Newark, Allied, and a few others turned up some here, some there, but not all from the same place. Do a Google search on one more of the part numbers and all sorts of companies pop up. Taking a quick cursory look at the schematic doesn't seem to indicate these parts are in highly critical areas. If the specs of the NTE replacements are close, they probably would work fine.

I am (trying) to debug and repair a TS-830s with low power output. I I have discovered a few transistors that have failed, and of course you don't easily (or inexpensively!) replace these with the exact parts, due to their vintage.

I have 2 questions for the group:

1. Are modern equivalents acceptable? NTE for example?

2. Has anyone ever seen a transistor / diode cross reference specifically for the TS-830S? Would save a lot of internet searching for datasheets etc.

I am just curious, as my first few replacements with NTE equivalents only created more problems - very disappointing!

I am chasing an ALC problem, specifically I am replacing on the IF Unit: Q30 and Q31 and on the AF unit, Q19 and Q20.

Any tips here?

Thanks

Kevin, anytime you need the JA transistors, always
ping me for them. I keep a pretty good stock of them
here or can put them on the next order from Kenwood,
Icom or Yaesu; also I have some sub. data in my own
parts list. Most all of the transitors in the 830
series are either available or there is a "non-NTE"
swap that will work.

Roy,
When you get all warmed up on the VFO and switch to the xtal osc
for 15 or so minutes and then go back to the VFO do you have to go
through the warm up cycle again?

Sam,
I only have the internal VFO. I think the drift is completely
temperature dependent. If I turn the 830 off on a hot summer day
where the temperatures in Sacramento go upwards of 100 degrees F, I
could turn the 830 back on an hour later and get virtually no drift.
In the winters where the temp in my shack (garage) could be down in
the 40's, the 830 will cool off fairly rapidly and in less than a
half hour, it would essentially be back to a cold start where it
would take another 30+ minutes to warm back up to a drift free state.

If they are the same grain-of-wheat bulbs as in the TS-820, then you can pick them up at Radio Shack. As I recall, you need to have three of them - two for the S-Meter and one for the dial. You might as well relamp them all. Also, if you don't have it already you might want to pick up a package of the heat shrink tubing (the small kind. The original bulbs are hard wired, so you need to lap solder the wires in place and the shrink tubing will be needed for insulation. It makes a much nicer job than using black tape which is guaranteed to get nasty and sticky over time.

Hi all, gecko man here.

I just got off the phone with a bloke and have negotiated a VFO 520 and SP 520 for my TS 520S. The vendor has told me there is no patch cable from the VFO to the transceiver and there is no documentation for the VFO either.

My Questions:-

1. Where can I get a 9 pin plug for the VFO (or can I use and old valve base perhaps)?
2. What is the difference between a VFO 520 and VFO 520S apart from the face colour. I know it will work because a friend has one on his 520S.
3. Can someone steer me to a circuit diagram for the VFO so I can make up a patch lead.
4. Instructions on use would be handy too, as I have never used an external VFO before :-)

BTW for the two items I paid (US $60:00)

Thanks for reading my post

Adam,
You have to make up a cable. The 9 pin connectors are available from
several sources. I think rfparts and maybe tower electronics carry

them. I use cat5 network cable to construct mine with some
heatshrink tubing.

Take the grommet out of the back of the meter; remove
the lamp, and cut the back off so instead of two very
small holes, you have one larger one that will allow
you to shove a 12v grain of wheat bulb in there.

Then find your bulb, and lap-solder and heat-shrink
the leads to the old lamp leads (hopefully you have
cut them off very near the old bulb, leaving nice long
pigtails!)

Don't use electrical tape... looks veddy badly!

1268. TS-820 ALC & Low Receive

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-02-05 22:52:34 UTC
From: Wayne
Topic: 1268 Message: 1268

Hi All
I am experiencing a couple of problems with my TS820 and am wondering if anyone can enlighten me with regards to these difficulties.
First, when the AF gain is fully wound up, the ALC works (via the meter)as advertised. When the AF gain is reduced from 10 on the scale to approx. 9 the ALC reading jumps up and then drops back to rest. As the AF gain is reduced further the ALC reading continues to rise until the meter is full scale, where it remains.
Is this normal or do I have a fault somewhere?
The second issue centers on the recieve side being low. I have adjusted the coil pack unit (mix and antenna coils) as recommended in the service manual yet still find that there is anything from 4-5 S points difference between the Kenwood and my Icom 746, using the same antenna and no preamp. The TS820 is always lower in reading, with the difference more noticeable on the lower bands (40/80/160).
Also, when following the manual using the marker signal as the source, I obtain little, if any, sort of meter reading on 80 and 160m. Read as barely moves off the stop, making adjustment on these bands difficult if not impossible. This could explain why the receive side is down!!!
Any suggestions as to where to start looking?

Thanks in advance.
Wayne

The little RF coil/transformer for 160 meters is
open.. this is the one that you tweak on 160, it's
also used as a transformer on all the other bands. The
reason the upper bands work a little better is they
are capacitively coupling through the bad transformer.

On the AF problem, are you sure that the outer
(silver) knob, which is RF gain, is not turning with
the inner (AF gain) knob?

Hi Bill
The ALC problem occurs when I turn the RF knob, not the AF gain as stated in the previous posting. I need to read what is written on the face of the radio!!!
The coil you refer to for 160m, is that the mix or antenna coil or both.

Thanks for the information. I will have to see if I can chase up a new coil. Will check the solder joints first as this set has suffered from a few dry joints.

Regards
Wayne VK2JKK

Hi Adam, aka Gecko Man,

The cable is 1-1 2-2 etc. pin 7 is no connection.
Yes, you can use old tube base if you like.

I used an old computer cable shielded and it works fine.

Manual available at http://www.mods.dk no charge to d/l file.

Here is source for the 9 pin male plugs
http://www.kenwoodparts.com located in NY State USA

part number to search on

E05-0901-05 TS-820 9P VFO PLUG TS-520 $ 5.04 plus s/h
not sure if they will ship to you in vk land.

Thanks James et al

I will check with Kenwood in Sydney for the plug. Have managed to find an RF Parts outlet in Brisbane as well, they might stock it... would be closer form me too. I don't think that RF parts VK is the same as RF parts in the US but its worth a try. Makes it nice and easy for a straight cable connect. I wasn't sure if that was the case.

Down loading the files from www.mods.dk right now.

Thanks for the help.

It's the antenna coil.

Also, the S meter going up with RF gain is normal.

Consider the RF gain actually is an "AGC Threshold"
control, not true RF gain, and it starts to make
better sense; as you increase the threshold, the meter
goes up to show you what strength of signal is needed
to go "into" AGC action.

1274. Drift trio ts-530s +quirck

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-02-06 17:13:20 UTC
From: blobby12uk
Topic: 1274 Message: 1274

Just a minor concern,but is 100 to 200hz drift after switch on
acceptable .Fifteen minutes later perfectly stable.
Also after a strong signal disappears I notice a slight kick as the S
meter drops back to 0,this is only noticable when the antenna is
disconnected or I have the attenuator on.The noise level otherwise
keeps the needle above the point where it happens,about s3.
Another way of describing the affect is that the meter drops back at
a certain rate ,quicky slows at 3thenreturns to the original rate to
0.
I know it is not a mechanical fault with the meter.
Is this just a quirck of these sets.
Further I always get between 5 to 8 s points of noise on all bands
with rf gain on max and att off.Is this about right because I am used
to ic706mk11g giving a bit less ,especially on the higher bands.The s
meter does sit at 0 with no input.
The reason I am asking this I have never seen another set of this
type to compare with.
Bob/G7JHW

1275. RE: [TS-520_820_530_830] Digest Number 321

Yahoo group: TS-520_820_530_830 (2001 — 2004)

From: Dave Greene
Topic: 1275 Message: 1275

Hi,

I'm experiencing a weird phenomenon with my 830S when operating CW semi-breakin on 80M. This happens every once in a while. I'll switch to 80, and it will sound noisy, not just static, but more like a warbling static that varies in tone and strength from S3 to S7.

Whenever I hit the key and transmit, then let up and the receiver comes back, the noise disappears completely momentarily, then builds back up in strength. When it disappears there is just a normal low level pure statis sound, maybe S1 or S2.

I originally thought this was just the receiver recovering. But last night I was operating with a guy who was also doing break-in, so we were goign back and forth in short spurts of transmitting. Often we were doubling up. I noticed when I let up on my key, that weird noise dropped off, but his signal strength remained S8 constantly.

So basically, the signal to noise ratio is much higher on my rig immediately after the receiver is switched back on, then drops. What could cause that? Some weird static discharge off the antenna or transmission line every time RF is applied??

Dave

ps. running 830S barefoot to MFJ tuner, tuner to a random wire.

Hi Bill
If I had taken time an looked at the circuit diagram before posting
my previous message I would have seen that it was the antenna coil!!!
Do you know what value it is, the manual lists it by part number
only (Item L8 Part No. L34-0542-05)?
Looks like it is going to be interesting to take the coil pack board
out of unit!

Thanks for info on the RF gain and the impact on ALC readings. Good
to know that all is well.

Bill,
My lamps do just that when I xmit with my 530S. They are located 1 floor above my shack almost directly overhead. The phenomenon occurs when I use a random wire or an inverted vee which is only about 15 feet away or so (outside). I have no other problems/symptoms. In fact, I assumed this was normal until I read this post.

Thanks,
Brett
BTW, wonderful group, glad I joined.

Bob,
i live in Manchester and my noise level on 160/80/40 is allways
around S7/8 , on the higher bands
it's not so bad. In the UK there is a real problem with electrical noise, we
all live on top of one another
every body has a house full of TV's DVD players videos not to mention
fridges freezers etc etc.
As to your drift on switch on i would say it was execptable, but stand to be
corrected,
the handbook says within 100hz during any 30 minute period after warm up,
then within 1khz during the first hour after
1 minute of warm up.

Cheers for now

Bill G4KKI

OK the lamps are QRMing your rig! Then, when they turn
on and off, it changes the frequency of the cheap
multivibrator circuit in the lamps; that's why the
interference seems to come and go.

Put some ferrite on your lamps' power cords.

I will have to check on the number.

You do not have to remove the coil pack board. You
will have to gain access underneath it; there is an
access cover, once you remove the counter/pll/vco
mess.

Have been able to remove the coil and it checks out ok with a
multimeter. A short between the appropraite pins.
The associated coils L24/25 also check out ok.
Realised that access could be gained reasonably easy after taking
the case fully off.
Is this a case where checking with a multimeter is not practical or
should I look elsewhere?

hi does anyone know whether it is
possible to use a transverter with
the ts530sp.I know that the 830's
are meant to be good to use with
transverters but was wondering about
the 530.i would like to try a 4m and
6m transverter with it but not sure
where to go for advice.Any comments
would be most welcome.all the best

Topic: 1284 Message: 1284

Hi,

I am looking for the pin out from the remote socket to key an L-4B amp. Has anyone made a cable to key this amp? If so would you mind sharing just what pins you used. Ameritron used to make a interface cable for the TS-820. They have since discontinued it. I have an Ameritron ARB-704 interface box. I would like to make a cable to interface it with the TS-830S.

Thanks,
Walt., KA2NJF

A bad winding would have read infinite. No, you done
good there... hmmm

doubt the RF amp is bad.

Any coils tuning wierd or not at all?

Everything feels fine when the coils are tuned.
Have previously checked the meter cal. and it is ok.
Low recieved predominantly on 80 and 160m as stated earlier.

1289. ts-530 max output

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-02-08 17:20:19 UTC
From: blobby12uk
Topic: 1289 Message: 1289

Into a dummy load I have been checking the max output on each band.I
have noticed that output is between 115w to 100w+ on top band through
10m,except 40m where the output is lower ,about 95watts.
I have tweaked the rx and tx coils according the service manual.
Any comments to what this may be.
Regards
Bob/g7jhw

Usually it's the opposite, lower on ten meters.

I wouldn't not be overly concerned

1291. R-820 Help! (receiver problem)

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-02-11 13:05:01 UTC
From: yv5grb
Topic: 1291 Message: 1291

Dear Group members,
This message was posted in December,...In the meantime I resoldered every board and checked for bad transistors. Any Idea?

Dear Friends,

I inherited (a present from a VE ham) a R-820 receiver but so far I am unable to put it to work...It presents two problems, may be interrelated:

- It do not receive.
The Af and Rf control seems to work, also there is a difference between AM/CW/SSB, but no (RF)signal is received, and VFO selectivity do not work same as Calibrator signal is never heard.

- Only one digit on the digital screen.
A "0" (cero) appears on the middle of the screen,(sometimes it is a "1") thats all.

I have been checking every circuit for visual damage, checked some voltages but everything looks OK...I'm not trained in electronics (but it is fun), Im an architect...So I will verry much appreciate some help.

Thank you

Eduard (YV5GRB)
(I do not have the service manual)

Wayne,

I read about your problem, I'm not an experienced repairman (only an HAM and architect hi hi)but have been able to keep my Ts-820 in working conditions in a Country as Venezuela were few technicians are available (and trusty).

My problem was when I touched the AF gain knob or a strong signal came in, the RF gain fully close,... the problem was solved when i found a cold solder joint in one of the trimmers in the AF board,... I would take the board out (it is one of easy access) and resolder all the points. (also check some components)

I hope you can solve your problem

73 de Eduard

1293. My two TS-520's

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-02-11 06:49:16 UTC
From: Jack Twilley
Topic: 1293 Message: 1293

I had my first TS-520 for almost a year when I accidentally applied DC power in reverse polarity. There was no visible smoke, but the radio "just broke". I eyeballed the visible components and couldn't see anything zorched, and there was no smell. When I powered it up on AC, it blew the AC fuse. So I bought another one.

This one seems to need new tubes, as I had to switch the driver tube in order to get it to tune up, and it tunes up to about half the power of the old one. It also seems to be "off" on some bands -- the peaks of RFI are shifted a few hundred kilohertz -- so I need to use the service manual to tune it up. Also, switching from TUN to CW on the second rig does nothing noticable, where on rig number one it seems to narrow the bandwidth and shift the frequency. The original rig came with a Fox-Tango CW filter, and I don't know if it's spoiled me or what.

Any help here would be deeply appreciated. I'm really hoping that all the second radio needs is tubes, tuning and TLC -- and it would be sweet if there was a failed diode on the rectifier board, or if the DC-to-DC converter had failed and I can find a spare. Thoughts? Advice? Sources for parts and tubes? :-)

Jack.

Do you have access to an oscilloscope?

You will need to check the VFO circuits for operation.

Hi Eduard
Thanks for the advice. I have already been down the line of checking solder joints. All boards in the set have not been checked completed but those that have all, showed signs of granulation, cracking and or general deterioration at various points on the boards. Definitely a good point to start. I am going to change the 1.8 Mhz ant coil in the coil pack as recommend ed by Bill. It checks out ok with a meter but stranger things have happened. Hopefully that will fix the problem. If not I will have to dive deeper into the bowls of the set. HI HI.
Regards
Wayne

1298. 520 SE/ transistor pinout

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-02-14 01:09:22 UTC
From: Jonathan
Topic: 1298 Message: 1298

I pulled the VFO out of my radio to clean and give it a check up ....I have a 100cycle drift and decided to replace Q1 on the VFO board to see if I could stop it. My problem is this, the original mosfet (3sk22-y) crosses to a NTE 222 which also crosses to a RCA 3N0204(which I have 10 brand new ones) can anyone give me a picture of the pinout for the RCA dual gate mosfet? I sure hate to throw 10 brand new transistors out ....or tear my radio down again..:(

Look at the rear bearing and wiper of the variable capacitor... should have some old dried up grease on it.

You can either drip some cleaner in there or add one drop of thin oil, sewing machine or 10W... hook the VFO up hanging outside the rig, cover off, and turn on the calibrator; run the vfo from one end to the other, listening to the heterodyne "sweeps". Clean the wiper until the sweeps are clean and smooth.

In reply to my own message hi hi.....the RCA should be a 3N204 and I tried it and it didn't work....I found the pinout for it and the hookup amounted to a game of "Twister" I spaghettied the legs but even though it was supposed to be compatible, it wasn't. If anyone has any original Toshiba 3SK22-Y or has found a source for them...please let me know. I cleaned the VFO, put back the old transistor, so far so good.

1304. [TS-520_820_530_830] Help with first qso's TS530 Tuning

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-02-14 15:43:20 UTC
From: KennyMac
Topic: 1299 Message: 1304

I am a brand new General...I know just enough to be dangerous...

I sure appreciate the help...here is what I have done...

I purchased a TS530 on ebay, no manual, and it appears to be in fantastic condition. Ditto for an AT200 tuner. I am using a G5RV slinky.

I have made one quick qso with a gentleman from Southfield, MI (about 60 miles north) so I know the tx does work.

I am assuming that the LOAD is what determines my power out? So I make sure I have it turned down or make sure I'm on a clean frequency...even when I crank it I can only seem to get the meter to peak at roughly 40W but I'm not even sure if that is bad or good because I am assuming my tuner's power meter is showing average power not peak...I do know to peak the Ip low and the RF high by adjusting the plate. As well as peaking the ALC using DRIVE. What does the DRIVE do? What does the PLATE do for that matter?

I have a long ground aluminum cable running from my upstairs shack to down below. About 40 feet I would guess. I am going to hammer a ground pole this weekend(I have no other choice for ground right now...) The tuner is grounded to the TS530. My antenna is a slinky G5RV and is up as an inverted V about 20 feet off the ground. It is being fed by TV ladder line. The V isn't at a very wide angle yet. I am still figuring out the idiosyncrasies of antenna / tuner / rig operation...

I would love to figure this out and make a qso one of these days. I am afraid I might as well purchase some new finals once I figure all of this out. I am assuming I need to do a lot of antenna manipulation still. The tuner is all over the board as far as SWR... and as I adjust my PLATE my SWR can go through the roof, but I don't know how much is the fact that I don't know what I'm doing or something in the equipment is haywire...I do know that when I key the mic and set to swr and calibrate I can peg the needle (they say to max it out, but that sometimes means burying the meter...) which don't seem right...

Any pointers would be much appreciated.

I'm Ken from Ottawa Lake, MI just north of Toledo by the way...nice to make your acquaintances.

Thanks again
Ken
KC8YYC

Peak ALC in TUNE mode, reducing CAR as needed to keep
ALC in scale. Then switch to CW mode and tune PLATE
and LOAD for max output or max RF on the meter. Don't
mess with the tuner; the 530 doesn't need it with the
G5RV. Just tune for max output.

Have fun and don't worry too much about it.

1307. MC-50 mic

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-02-15 03:01:18 UTC
From: Kyle
Topic: 1307 Message: 1307

Hi group:
Last time I wrote in (first time) I announced that I was going to keep my TS-520 instead of buying a new rig. I had no accesories also. I do not have any hf experience or ever had my TS and up and running.
Well I got everything now except the VFO-520 (till tuesday anyway).
I even got the AT-200 tuner! In the past every time I ever looked for accesories I never could find any. Now I find them everywhere!
Everything I got so far is in "mint" condition, except for the MC-50 mic.
I won it off of E Bay. I know you take a chance on buying things from there.
I got the mic today. It looks great but I heard something rattling around inside the base. I took the cover plate off (one missing screw) and I found a lead fishing weight inside?? I also noticed the wiring (four wires) was cannabalized (spliced) with bare wires showing (nothing to keep them from short circuiting). I`m kinda mad! The person who sold it advertised "mint" condition and works great! Can`t wait for his response.
My question to the group is:
Why in the name of blazes would anyone cut up the wires inside of a mic for?
And what`s up with the fishing weight? I often heard of the TS-520 being called a boat anchor but I didn`t take it literaly?
The mic came with a homebrew
four-to-eight pin adapter, so you can use it on different radios. My next question is that don`t older radios (like my ts) and newer ones require different microphones? Something to do with ohms?
Thanks for listening to me rant & rave.
73`s Kyle n0mkh

1308. Cleaned 520SE VFO...still drifting

1311. Thanks - TS-520 VFO male plug

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-02-16 10:02:04 UTC
From: vk4kss
Topic: 1271 Message: 1311

Hi all,

Thanks to all who replied on this topic especially James for the
Kenwood part number (E05-0901-05). Cost AU$4.55 each (including
"Johnie").

No one in Queensland stocks this plug, but Kenwood in Sydney has
(had)
4 of them. As it turns out these have been sitting on the shelf for
some time, the last time someone purchased them was in 1989(!!!)

I have taken the last 4 they have, as I know a friend who has been
after them for some time as well, so I grabbed a pair for him too.

One other "possible" source in VK (for those that are interested) is
Panapex Pty Ltd in Chatswood (also in Sydney) Phone +61 2 9410 9933.
Apparently they stock SATO components.

Again Many thanks

73 Adam VK4KSS

P.S. For those that don't know, "Johnie" is slang for Goods &
Services
Tax (GST). John Howard our current Prime Minister was the one who
introduced GST hence the term "Johnie" or "Johnie Tax".

1312. LSB not working on TS-530S

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-02-16 01:56:53 UTC
From: Steve
Topic: 1312 Message: 1312

I have a TS-530S and the LSB mode is not working. When I switch the MODE control to LSB, the receiver cuts out and the frequency LED display no longer illuminates. The meter and VFO lamps stay on. I am not able to transmit either. However, USB, CW, and TUNE positions work fine (transmit and receive).

I thought it could be a dirty or bad connection on the MODE switch. Looking at the schematic there are about five or six functions that the MODE switch handles. In all but one the LSB connection on the switch goes through USB. The one that doesn't leads to the PLL board. I checked for conductivity on the switch and it seems to function ok connecting the PLL to the LSB path on the switch, then no conductivity when I turn the MODE switch to USB or CW.

There's not much unique on th PLL board between LSB and USB before they meet, just a couple crystals. Again, USB works fine. Visually I can't see any problem on the PLL board where LSB meets and I probed around for conductivity, which may not tell me if a crystal is bad, for example.

I can't figure out why the frequency display cuts out when I select LSB.

Any leads on what could be wrong with my rig? Thanks in advance for any suggestions.

73,
Steve

Ken, I own a TS-530S, too. Here's how I tune it. Set the MODE knob to TUNE, the meter control to ALC and peak the DRIVE. You might need to adjust the CAR control so you get a meter reading that will allow you to determine a peak point.

Switch the meter control to IP, keeping the MODE in TUNE, and dip the PLATE by selecting the lowest reading. Then switch the meter control to RF and peak the LOAD.

After this you could switch the MODE to CW, turn the meter control to IP again and dip the PLATE. Then, switch the meter control to RF and peak the meter by alternating the PLATE and LOAD controls. I usually adjust the CAR level so my power output is below 40 watts, and I keep the transmit to only a second or two while I strive for a peaked reading. Then I adjust the CAR level so I can get the maximum output, which is usually 100 to 125 watts. My finals date from 1981, but I probably have about 1 to 2 years of regular use on them after all these years [off the air for about 18 years during that time].

I'm near Grand Rapids, so I'll look to hear you on HF in the future. Good luck with your new rig!

73,
Steve

OK Gang,

does the 530 have separate LOs for usb/lsb, or is that
a PLL loop function?

If it's separate xtals, you just have one not
working... try changing the LO osc transistor first
before ordering a new rock. Much cheaper.

Hi Adam

I do not know if this will help you with what you want but look at: http://www.mods.dk/ click on Kenwood on top then on manuals on the left. When it gives you the list of manuals available you will find a service manual for both the TS-520 and TS-520SE. The service manual for the TS-520 includes info for both the external VFO and external sp-520 speaker. Let me know if this helps.

A friend of mine, Vince, N2VJ, wants to sell a TS-520S (if memory serves me right). Non-working order, exterior cosmetically fair to good, all the boards inside are present, internal wiring not guaranteed (he acquired this unit a few years ago and can't remember exactly what was wrong with it, it was an SK purchase).

He wants $100, prefer pickup in Sunset Beach, NC; email him and you may be able to work out terms for shipping, who knows, that's between you and him.

Contact him at his email at (his call letters at atmc dot net).

Either Ebay, or Inrad. The inrad filters are much
better but require mounting with double-sticky tape
and short pieces of coax as they are sometimes larger
than the originals. The gain in performance is well
worth it however.

I have a TS 820S and a Heathkit SA 2060A tuner, both given to me. I was also given the following dipole antennas:
3 band trap dipole, supposedly cut for 20/40/80 meters, a 32' dipole, a 66' dipole and one that's even longer (I haven't had a chance to measure it yet). I live in a rather small lot and have put the 3 band antenna up, but as I'm still a Tech, I haven't used anything yet. I'm wondering if it might be best to put up the longest antenna I can get in my yard and use the tuner to make it resonant on whichever band I'm wanting to work at the moment. I have one 40' tower and I suppose I can put up a second antenna at 90 degrees to the other, but I don't want to make them effect each other.

Thanks.

Topic: 1325 Message: 1326

Hi Chris,

The tuner does not make the antenna 'resonant'... only its natural length (or abbetted by inline inductors, and other loading devices.) can make it resonant. What the tuner does is convert the impedance on the feedline where it attaches to the tuner into something approximating 50 ohms for the transmitter to work into. It is a "matching unit". There are many non-resonant antennas which work quite well. Height is very important if you wish to work DX. It is the height of a dipole (or other antenna) which determines the 'launch angle' (which one wants to be low for DX) at which most of the signal leaves the antenna. For this reason, many hams with simple antennas choose the 1/4 wave vertical antenna which, operated against a good RF ground has a very low launch angle. At 40 feet, you are just over 1/2 wave on 20 meters, and just over 1/4 wave on 40, etc. On 80 meters, you have what is called a "cloud warmer"... where the radiation is going almost straight up. At 1/2 wave height above ground, your dipole major lobe will launch at about 30 degrees. The same antenna at 1 wavelength above ground will have two lobes, one at 15 degrees, one at 45 degrees to the horizon. For DX, most claim the optimum launch angle is between 15-20 degrees.

You might even consider a vertical ground plane placed on top of your 40 foot tower... something like the butternut vertical works great in that mode. Or, even one of the small beams by Cushcraft or Butternut.

The antenna farm here is: On 40, a 'bobtail curtain'... three vertical elements in phase. (height is 37 feet on three home made 2x4 masts), with a 20 meter bobtail nested in one of the legs of the 40... height 17 feet... and one semi-G5RV fed with open wire line (balanced feeders), which I can load with my MFJ tuner on any band! I have even made contacts on "top band" 160 meters with it... height is about 38 feet in the middle, with drooping ends. It was originally an 'extended double zepp for 20 meters)..I put this antenna up when I first got back on the air last year and worked 128 countries with it during one of the DX contests before the 'better' antennas were erected. So simple, and low antennas can work, and work well. But, in a pileup, you need all the help you can get for that 'new one'. Missing a 9V1 on 40 (huge pileup) this winter convinced me to finally (after 47 years as a ham) to go QRO... so, that project is underway.

I am a proponent of the best RF and DC ground you can get. I 'scalp' my lawn down to almost dirt, then lay galvanized chicken wire down. When the grass regrows, it covers the ground screen, and can be mown over. I (using acid core solder) connect the various runs of chicken wire together, and thread a few runs of copper wire which I bond to the chicken wire about every ten feet or so. At the moment, I have six eight foot ground rods, all interconnected with #4 copper (some old power company wire I got for free). The one closest to the operating position has a piece of 1 inch copper strap from the desk ground strip to the rod. A total distance of around 6 feet. The furthest ground rod is about 100 feet away, and is the one that grounds the 40 meter bobtail at the feed point, while another grounds the 20.

For my money, the 20 meter bobtail is the most overlooked antenna going. It can be built cheaply and hidden very easily. When in Ft. Worth some years back I lived where there were antenna covenants. I hid my antenna in some photina bushes, and no one ever knew it was there. (Hard to see, even if you knew where to look) I used natural supports (trees) and used copper clad steel wire. It requires two or three supports of 17 foot height, and a total length of about 67 feet... It gives 4.8 dB gain, and low angle vertically polarized radiation in a broad figure 8 pattern. Worked 158 countries on that one with no contests.

regards and good luck

NY0Y

Put 'em all up, make 'em fit the lot; tune the
20/40/80 for your favorite parts of those bands, use
the tuner for the rest. Longer antenna can be your
SWL antenna.

Topic: 126 Message: 1329

Hello...I have searched the archives and have not seen any comments on adding the digital display option (DG-1) to the TS-820. I have also been unable to find one! Any ideas where a person could find a decent digital display. My 820 is a backup backup, but I still always thought it'd be cool to have the display kit installed. If anyone knows where a guy might find one (if possible) I'd appreciate it. I see the boxes for 520's (DG-3) on eBay but have had no luck finding the 820 kit. Thanks for the help! 73 Brian N8AVR

Best bet is to find a "parts" 820 with display intact.
Then you will have spare xfmr, etc to keep your
back-back running.

1332. HELP!!!! TS-520 Problem

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-02-25 16:51:35 UTC
From: n2tmc
Topic: 1332 Message: 1332

I just got a TS-520 and it's dead. These are the symptoms:

1. When you turn the power on, the meter snaps all the way to the right. If you leave it sit for an hour or so it will slowly move down to zero.

2. There is no receive. There is no static. There is no nothing.

I have the rig connected to a 10 meter Hamstick and I know that it's working because a friend attached his rig to it and we were able to receive signals. But all the 520 will do is light up, the fan goes on and sooner or later the meter needle will end up on zero

The rig has an internal 12vdc supply for the low
voltage stuff, sounds like this has failed.

>down to zero.

Let the rig cool down and remove the top cover. Locate the regulator board, it is the one in the center on top. On this board locate VR3, it is slightly to the right of center near the front of the board. Power up the rig and use something non-conductive to firmly push down on the variable resistor without adjusting it. Does the S-meter return to center or at least jitter down to the low end of the scale?

>2. There is no receive. There is no static. There is no nothing.

Is the Function switch set to VFO and the VFO shorting plug installed? Any sound at all from headphones? Even with no signal input there should be audible white noise with the AF gain turned up.

As for item 1...it didn't change anything when I pressed on VR3.
As for item 2...I don't have any noise at all....speaker, external
speaker or headphones.

1336. Signal needle pegged with external VFO

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-02-26 10:34:19 UTC
From: Adam VK4KSS
Topic: 1336 Message: 1336

Hi all

First off thanks to all those who responded to my question on VFO cable plugs. I acquired the last 4 in the country (according to Kenwood Australia) 2 for me and 2 for a friend.

Now, to the my question

I wired the VFO patch cable up as suggested by all you fine people, and plugged the VFO 520 into my TS- 520S. The VFO has been in storage for around 5 years so I expected some problems, dirty contacts etc...

The VFO initially would skip (or drop out) when tuning through the bands (observed on a frequency counter). I managed to fix this with a blow out of the capacitor in the VFO "box". I also had to adjust the RIT using VR2 as it was a little out.

Now this is the one that has me stumped. When I transmit with the VFO in "OFF" the needle on the radio pegs to the right hand side and stays there. This also occurs when in "REC/ XMIT" and "XMIT" but intermittently on "REC". When in "REC" sometimes the radio pegs the needle and it stays there other times it pegs the need then drops back to normal after a few seconds. On other occasions it operates normally. I can't see any obviously broken wires and tapping the VFO gently has no effect.

When I disconnect the VFO from the Radio and insert the original jumpered plug all works as it should.

Any ideas?

1337. Help tuning TS-520 transmitter

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-02-26 16:03:31 UTC
From: emikemcc
Topic: 1337 Message: 1337

I recently acquired my General License and then bought a TS-520 on ebay, my first HF rig. I presently have it connected to a ~70 foot wire through my MFJ 949E Versa Tuner II (I previously had this wire connected to an old Hallicrafter SW receiver). It receives well. When I switch my MFJ 949E Versa Tuner II to the bypass dummy load and attempt to walk through through the tuning procedure. I run into some trouble.

I am following the procedure as described in the TS-520S Operating Manual (I don't have the 520 manual). I'm beginning on page 20 under 4.11 Plate Idling Current, trying to tune to 80 meters. Initial switch settings are as outlined in Table 2 of the manual (on the same page). I set Meter Switch to IP, Mode switch to LSB. The H. SW is on (up) When I flip the Stand-by Switch to Send (up) I get no meter reading, even if I adjust the side panel BIAS control. Note, two days ago when I walked through this procedure it seems to respond as it should. Changes I made since then include moving the wire so it doesn't rest on tree linbs outside, and I ran a ground wire from both the MFJ 949E and the transceiver to the middle screw of a metal face place of a near by outlet. One other thing I noticed is that I can clearly receive even when I switch to the dummy load. I don't know if this is expected or not.

My biggest fear is that I have somehow fried a tube. I was hoping to hook it up to a dipole this weekend finish the tuning and get on the air. Does anyone have any thoughts or suggestion for me?

Thank you in advance.

If there is a SG (Screen Grid) switch in the back, it
must be ON to get plate idle current.

I don't understand why you can receive "clearly" on the dummy load. I have heard strong nearby stations without any antenna attached at all, but nothing like I would get with the antenna. At any rate, if you are sure the antenna is cut to an appropriate length you might want to remove the tuner from the circuit at this point - fix one thing at a time.

Secondly, the "ground" you have set up is not adequate either for safety or operating conditions. Grounds rods are pretty cheap so get down to the electrical supply house or hardware store and do it properly with some HEAVY gauge copper wire (like #4 or #6).

As to your other problem, the only thing I can think of is that you don't really have the mode switch in the proper position or, if you do, it is dirty and not making the proper contacts. Try it on a different position, like USB, or wiggle it a bit to see if that helps. If it is dirty, get some good contact cleaner and give it a bath. If you have it in the wrong position, smack your forehead with the palm of your hand and in your best Homer Simpson voice say "DOH!". Also, you did give the heater a bit of time to warm up those tubes, right? They need three minutes or so before you tune.

Good luck and 73,
Jim K1ZC

1344. Re: Signal needle pegged with external VFO

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-02-27 20:31:04 UTC
From: Greg
Topic: 1336 Message: 1344

Adam, I too wired up my own cable to the VFO820 from my TS820s. One thing I have found is that it will appear the plugs a inserted firmly and correctly, yet wiggling them will prove that the pegged needle, or lack of signal, was caused by the plug to socket fitment (on both or either end). At least thats been my experience.

The pins and sockets have been cleaned, but I found I had to gently bend the pins slightly in order to maintain ALLL pins making sinultanious contact.

My sympotoms have been similar to yours, as well as having no audio due to the lack of any RF signal. Just looking at the plugs isnt good enough...even pushing thm into the socket doesnt help. Give them a wiggle frmn side to side and your problem area may become obvious. After they make a good connection, you may find after not using the radio for some time,the problem will reoccure. You will then have to repeat the 'wiggle' exercise.

>or either end). At least thats been my experience.

Thanks Greg

I tried that but it had no effect.

After you mentioning bad connections, I tried looking for other possibilities. I couldn't figure out why the problem didn't occur when on dummy load. Then it hit me (burned me actually). RF is getting into the VFO, even though I have it earthed and am using shielded cable

On 40m the VFO works flawlessly but on 20m it only works on the REC and REC/ XMIT modes, when OFF or on XMIT the signal needle shoots to the right hand side of the meter. I haven't tried the other bands.

We are currently in drought here, so I went out with the hose and wet all the earth points for 10 minutes, and guess what. The VFO works, but as soon as the ground dries out the problem reoccurs.

Thanks for your input. I'm away for a weekend of building resonant antennas and better earthing.

Try a different jumper. Sounds like you have one that
is a bit leaky.

1348. Re: TS-520SE VFO DRIFT ON POWER UP

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-02-29 15:59:58 UTC
From: wa5jaw
Topic: 1201 Message: 1348

Bill,
I will try what you have mentioned. I cannot seem to determine from the schematic the voltage path (source) for the VFO. The pin on the schematic for the VFO is labeled either (8) or (B). Not 9 as is the case with other 9VDC inputs to cards. I traced the voltage source through the external VFO plug pin 7 to 8 then to the wiper arm of S2-2 the function switch. From that point it seems logical the power would come from the wire connecting S2-4 (wiper) to S3-3 (wiper) and beyond, but, the beyond pins seem to be destinations not a source. Can you help me determine the path for power to the VFO. It does not appear to be just 9VDC from the regulator.
Again thanks for the help,
Sam WA5JAW

None of the tubes seem to glow. even in a dark room. I just find it odd that all of a sudden ALL the tubes went bad. I have bought replacements on ebay and am now awaiting their arrival. Now when the arrive and put them in I will have to neutralize the finals. According to directions I have I will to acquire an RF Voltmeter. How does an RF volt meter differ from other voltmeters? How do I attach it to get the readings I need? What if the new tubes don't glow, what should I try next?

Is the heater switch on?

An RF voltmeter reads the RMS value of an RF source. Probes are available
that do the same thing using a regular DMM. Another option is to place the
radio next to another receiver/transceiver tuned to the same frequency and
then tune for a minimum S-meter reading on the receiver.

I'm looking at the Troubleshooting section for the TS520 and it shows:
SYMPTOMS: ALC meter deflects with no output (no plate current)
CAUSE: REMEDY
1. No high voltage (+800v) on the final tubes. Check the HV
power supply
2. Bad final tubes Replace
the tubes
3. SG switch is turned off. Slide the
switch up

The Service manual has eleven causes for no output or low output. If you
haven't already done so it my be a good idea to download the service manual
and look for a cause and fix there. BTW one of the fixes is check the
continuity of that SG switch to see if the switch may be bad.

Mike you don't need an RF voltmeter to neutralize new
tubes.

YOu need to troubleshoot your filament circuit; that
may be the problem, rather than tubes.

Have you looked inside the rig yet?

1353. Two minor defects

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-02-29 18:24:52 UTC
From: Jack Twilley
Topic: 1353 Message: 1353

I seem to have broken the extended feet on one of my rigs. These
things are readily available, right?

Also, on my original rig, switching from TUN to CW would change
filters and change the receive frequency something like 700 Hz. To
receive CW signals, I would first zero-beat in TUN, then change to CW
to get a tone. That's no longer working -- when I switch from TUN to
CW, I get no change in frequency and I can't notice any filter
change. Does this mean I have a broken CW filter? Are *those* things
readily available?

Jack.

I can't be sure as there is no drawing breakout for
the feet, but the service manual lists only two of
these as "accesories":

FOOT J02-0049-14

So I am guessing that these are the extenders that
came as accessories.

These are listed as still available from
www.pacparts.com, at about $1.20 each.

click on Consumer Electronics>>Search and Order Parts
online>>Guest (continue)>>select Kenwood as
manufacturer, then click on part number, then enter
the number above.

I think they have a 25.00 minimum; if you cannot make
this, I can order the pieces for you but it will wait
until my next parts order cycle to save costs.

Is there any chance that I could get a CW filter and/or an SSB filter
from the same place? It's nigh unto impossible to search their site.

Jack I will check on p/n from Kenwood for you later
tonight.

On your mode switching, sounds like broken wire on or
near the mode switch.

I'll check for a broken wire. Thanks for looking for the part
number. If they're not too expensive, I'll get two of each, and
that'll *definitely* put me over $25.

Those you do not want to buy from Kenwood.

Use the Favorites Search function of ebay to look for
the filters that you need; or, get the ones from
Inrad; they will take a little inventiveness to
install as some of them are not "bolt ins".

Please go through your symptoms again, I am not so
sure you have a bad filter. These rarely fail,
especially both at one time unless the rig has been
dropped hard.

Pardon if this has been beaten to death... I'm new here! Other than the lower plate dissipation for the 6146A, are there any other concerns I should have using these in my 520S? Will they neutralize OK? Or should I just bag them and get a set of 6146Bs?

Jim.

They will work fine; if you are running PSK, just keep
your output around 25 watts or less. With B's you can
go to about 45 or 50 watts.

If you are handy, it may actually be more economical
to run A's in there, maybe you have to change them
every 6 years instead of every ten? hi.

Lube yer fan while you are in there. Any hypo-type
oiler will work; there are little holes in the bearing
cups on either end.

If you have a 0.001 uF 1000 volt disk cap, solder it
across the fan terminals, will help prevent harmonic
radiation on the AC line from the fan leads.

Wow! Thanks Bill! Probably will run SSB only (well *MAYBE* a little CW ;) ... I'll just tune up quickly and not load it so hard. Thanks also for the fan advice. I'm a firm believer in keeping things cool. I had a Swan for many (10?) years and had a muffin fan to pull off the heat sitting right above that 6MJ6... never had to replace that tube... and that was a sweep tube <ugh!>.

BTW, this is a great board! Learning a lot!

Jim.

Just a little concern of mine.When I tune the set up I can get nearly 110 watts on 80m ,100w on 10,however the next time I come to use the set,say the next day, the output will be 5 or 6w lower.
Is it worth taking the 6146b out and checking the pins and anode connections are clean,electrically.
Regards
Bob/G7JHW

5 or 6 watts out of 110 could just be line voltage
changes.

Does anyone have or know where I can get a Universal Coupler for the rod on the band switch. The part number is D22-0409-05/D22-0402-05 according to the manual. My radio has one that is cracked and the radio will only work on the lower bands.

Thank you for any help.

Pacific Coast Parts. Easier to call than order via
web. about ten bucks.

They have a 25.00 minimum; if you can't make that or
don't want to, holler at me and I can get you one.

I used 6146W's in my 830 for ssb and cw for years and they seemed to be a
much more durable tube than the plain, a's, and b's. And I pushed the rig
to the full hilt!

From: Bill K0ZL
Topic: 1359 Message: 1371

Yes and no.

The W is still 25 watts plate dissipation, whereas the
B is 35 watts.

Keep in mind, any tube can be run over it's plate
dissipation for short periods of time; ssb and cw are
fine, but PSK, AM and FM will cause plate dissipation
to be exceeded for longer than might be desirable.
While this won't necessarily kill a tube, it will
shorten the life. How much depends on the "area under
the curve", that is, how much and how often the
ratings are exceeded, along with cooling; a 25 watt
tube with lots of cooling might fair better than a 35
watt tube with a dirty fan or one that's frozen up.

The thing that seems to kill tubes, regardless of
variety, is excessive key-down time out of resonance;
guys that don't know how to tune up quickly (or have
forgotten or lost their touch) are murder on any tube;
sweep, 6146 or big linear tubes. Get them resonated
or dipped quickly and you will go a long way toward
preserving your tube life, regardless of the
application.

Thanks to all of you that helped me with my TS-520 problems. The best thing was when I attached all of your responses and emailed them to the guy who sold it to me. He took it back at his expense and will be having it fixed and sent back to me.

Again, thank you all very much!

From: Jon (M1CBH)
Topic: 1375 Message: 1375

Hi Group,

My name is Jon and hold the callsign of M1CBH.

Just been lent a TS-830S and wanted to ask a few (maybe silly) questions.

1. The manual seems to suggest that during tune up, you adjust the plate control for a maximum reading on the meter(with the meter switch to set RF), should I peak it, or dip it?

2. Is there way to reduce output power(sorry for this question, but i'm used to a "set power" button).

These questions may appear silly but it's the first piece of valve equipment i've ever used.

thanks in advance,

regards and 73's,

de Jon, M1CBHr

Hi Jon,
name here is Bill, G4KKI in Manchester, if you look in the TS830
Manual page 18
you have missed a paragraph which is between nthe 2 pictures of the 830, it
is para 6,
it tells you " place the meter switch to IP and dip the plate, dip will be
typically only about 5ma. then you
go to para 7, whereit syas place meter switch in RF and peak the load
control.
I usually tune my TS530 up into a dummy load first and then switch over to
my antenna which is allways
tuned to the band i am operating on.

PEAK IT on RF; DIP IT if looking at IP.

> 2. Is there way to reduce output power(sorry for

Yes, in our files somewhere is a schematic using a 9 volt battery and the "alc" input in the back of the rig to "fool" it into running reduced power.

No, plate dissipation does not determine output; tube
conductance, circuit design, and most importantly
screen and plate voltage determines the max output.

An "A" or "W" tube may actually have more gain and
more output than a given "B" series tube.

Bill G4KKI ;

There seems to be 2 versions of the 830 manual, my original copy(page 18 paragraph 6) reads "Place the METER swithc to RF and peak the PLATE control"

But the copy i've just downloaded(from mods.dk) contains the statement from your email.

QTH is Mansfield, Notts by the way.

Bill K0ZL;

I had a browse through the file section as soon as my membership was approved, didn't notice the 9V battery circuit, just had a look again and found it.

I've got an old SWR/Power meter that i might build the circuit into.

thanks and 73's,

Jon M1CBH

From: w0spy
Topic: 1384 Message: 1384

The Heater switch and the Noise Blanker switch paddles are messed up on my TS-520. I pulled the plastic paddles out and flipped the switch up or down with a small screwdriver and am just leaving them alone now. Has anyone replaced them? Can you just replace the paddle and get the switch engaged OK? Where is a source of switches?
Don

1385. TS-530s extremely poor rx sensitivity

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-03-09 23:07:23 UTC
From: Ron Kienzle
Topic: 1385 Message: 1385

I have acquired a TS-530s in excellent cosmetic condition. I would like to sell it. However, it has extremely poor sensitivity -- it won't even hear the calibrator signal at frequencies below 20 meters and just barely at frequencies above.

It transmits just fine. Looks good on the scope. Full power on the wattmeter.

I tweaked the IF coils and the Antenna and Mixer coils -- absolutely no affect.

Is this rig a basket case? Should I sell it as is (I'd need to get about $235 for it)? Should I send it to K0ZL? Or, am I overlooking something very simple?

Thanks in advance for any help you can come up with.

73,

G'day Guys,

I was wondering whether I need disconnect my antenna from my TS-520 and earth it when not in use. I do this each day as a matter of course, but perhaps there is no need seeing the rig is earthed. I have an SO239 that is attached to my earth bar and it's into this that I connect my antenna when not in use. What's thea general thinking on this?

Cheers
Grant

Topic: 1386 Message: 1388

Hi, Grant. Lightning is strange and it will do anything it wants to, grounding (earthing) or not. I believe that it is nearly impossible for the average ham to fully protect against it.

However, one thing you can do is to guard against the build-up of static electricity and bleed it to ground before large potential differences build. When not in use, everything should be grounded -- your rig, your antenna, your electrical system. Grounding the rig itself has some interesting possibilities -- if your ground system isn't perfect, you could be providing a path for transient currents to enter the rig; on the other hand, short circuiting stray EMF to ground will help prevent damage to the transceiver. Obviously, you need to completely disconnect the feedline from the rig and ground both conductors, too.

The techniques for doing this can be elaborate. There are several articles in back issues of QST. Maybe I'll write one myself someday -- but brush up on grounding techniques and you'll be fine.

What is your hull material? -- if aluminum or steel you are extremely fortunate. If fiberglass, like my 44' houseboat, you have some work to do. You need a minimum of 150 square feet of ground for HF transmission on a boat. Then, you need to worry about electrolysis. Icom marine used to have some technical information about grounding on their website -- google around and see if you can find it.

First rule: Have FUN!

Hello, my name is Bill and my call is W8EFA.

Suddenly I can not transmit on 10 meters. I notice that the band switch is a little intermittent in that if I move it around a little signals come in and out on receive .

If I open the case can the switch be checked or cleaned or what would you recommend?

Thanks,

Bill

Good to hear from you again, Ron!

Most likely, a bad 160 meter antenna coil. These are
used on all other bands as a transformer, so if it
fails, everything goes.

230 would be good price as-is and would allow for
repairs.

73,

Bill K0ZL

Most of the lightning damage I have seen came in on
grounds; if the antenna was disconnected and the rig
damaged, it came in on the AC line, through
accessories or up the ground wire itself.

Pulling the antenna off will help but if the rig is
connected to the antenna ground some other way, the
current can still cause damage.

#8 green wire to your boat ground plate connection.

Critical to safety as the 530 has a two-wire cord and
there could be enough leakage to cause some discomfort
to the operator! or the wife (shudder).

Ground the rig before plugging it in.

I use a hand mike from an old Drake 2 meter rig
on my 530s good reports and Works great.
Why, the ham fest was almost over,
had to buy the rig with the mike and then resell rig (hate two meters)
Try doing that on ebay!

Thanks everyone for answering my question about grounging the antenna. Good point you raise, Bill. I guess disconnecting the antenna from the rig is a must, but are you saying I should also disconnect the chassis ground as well? What I have in mind is using one of those coax switches to switch the antenna from the rig to ground. That way I won't have to physically unplug the antenna lead each time I shut the station down. That would be sufficient, wouldn't it?

Hi George,

You could do a lot worse than the Kenwood MC-50 desk mic. It was the recommended unit for the 520 and there are plenty of them available through the various sales and wants boards (and eBay if you want to take your chances!).

I use one on my old TS-820 and the audio reports are always very good.

That's the sheet metal enclosure for the power tubes.

Look for the coupling, a plastic piece that goes
between the rear-most part of the bandswitch in the PA
cage and the long shaft that does the rest of the
bandswitch job.

You can change this yourself with a 1.5 mm hex allen
wrench and some coaching.

Like I said, most lightning current comes in via the
grounds! that would be the shield braids on the coax,
the grounding switch and the big green wire to ground
from the rig chassis.

More later...

Hey Bill.....
Bill has probably hit the nail on the head.....common problem with KW 520-830 rigs. Band switch is plastic with set screws often tightened down and causing cracking (especially on 10 m for some reason) and the use of dis-similar metals on the band switch contacts themselves. Had same problem with my old 830. Fix was not expensive. Of course definition of expensive is in the eyes of the beholder...hi hi

No, that absolutely will not be sufficient. Your system, if struck by lightning, will act as a voltage divider...Yes, the majority of the current will go toward ground (until it burns up one of your ground connections) and then could jump as much as several inches to find ground some other way.
I work on broadcast transmitters and have seen a lot of lightning damage. All broadcast trasmitters are grounded much more thoroughly than any amateur station, and lightning still gets them from time-to-time, and not just mountaintop locations either. I'm not saying that I always do it...but we SHOULD always disconnect our antennas, and I always try to when storms are forecast.
NOTHING will protect you from a direct strike.

Paul K4PDM

1408. Re: [TS-520_820_530_830] Grounding the rig

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-03-11 02:13:38 UTC
From: Bill K0ZL
Topic: 1401 Message: 1408

Ok here is my setup:

All of my antennas come to a bulkhead built into the outside wall of the shack; bulkhead is copper plate about 12" square with UHF bushings or feedthru connectors. Coax ends at the bulkhead out side, then I use coax jumpers to what ever radio I am running.

I cut a hole in the wall and framed it for the plate. the plate is on the inside wall; the outside is recessed and trimmed with plywood to look nice. Sort of.

When t'storms approach or when I leave the shack during the lightning months, I just disconnect all the coax cables from the bulkhead. They hang down on cable clamps so that they are easy to restore when I am ready.

Now, all the rigs are grounded for safety either through a third prong AC cord, or through the negative return to the DC power supply (which is grounded via 3rd prong to the house safety ground). That way, the safety ground is SORT OF separate from the antenna ground. Oh yes, the bulkhead has it's own ground rod, separate from the house ground.

So I have somewhat broken the major current loop that would exist through the coax braid grounds to the house safety ground.

If the house safety ground gets lifted above "real" ground by lightning strike, everything that is on that ground goes with it. No damage occurs until the potential is reached where things start to arc over to neutral, or to hot thru the switcher power supply, or whatever.

If the antenna grounds get lifted above "real" ground by a strike, again nothing happens unless the charge starts to migrate elsewhere, which it usually does.

I have had several very close strikes that in the past I know would have blown things up in the shack; and, knock on wood, I have not had any lightning damage in the shack since installing the bulkhead and USING it.

Paul is right... when things start getting lit up in
the shack, there's going to be damage.

All that stuff I posted will help reduce induced
current damage and may even ride you through a very
small feeder strike (the ones that are invisible on
the time-exposures that you see of lightning hits).

Will also help with rain or wind-induced static hits,
which are a majority of my static damage repair work
by the way. Nothing outlandish, just a punched-out
switching diode or minor board damage, or blown surge
arrestor tube.

Broadcasters can't disconnect; they have to TAKE IT,
hehe...

Well the coupling is about six bucks.

It's the labor and shipping that can get ya.

From: f x
Topic: 1386 Message: 1411

G'day Grant,

I guess I am a little late in getting to this thread, but here is one more contribution. First, I use antennas which are already at earth ground for DC. These can include most verticals which have a choke between the center conductor and ground. Not possible with dipoles and the like however. Most beams run at DC ground as well.

The earthing setup here is a total of five rods each eight feet long driven in to be flush with the soil surface. These are spaced about 25 feet apart, more or less and connected with #8 copper. In addition, this is interwoven with about 1000 square feet of chicken wire, hot dip galvanized after winding, and bonded with solder and the #8 copper. This is separate from the power line ground, another two eight foot rods out at the poles.

The connection to the shack equipment is via a six foot length of 1 inch copper strap. Each piece of equipment is connected to this copper strap.

I do not disconnect my antennas from the house entrance as Bill does, but I do use an antenna switch to disconnect the antennas, and to ground the input to the rig. A direct hit could arc it, I am sure, but nothing protects totally when God gets angry. Have survived several close hits as Bill described.

Regards

Raleigh NY0Y

Grant McDuling <grantmcduling@...> wrote:
G'day Guys,

I was wondering whether I need disconnect my antenna from my TS-520 and earth it when not in use. I do this each day as a matter of course, but perhaps there is no need seeing the rig is earthed. I have an SO239 that is attached to my earth bar and it's into this that I connect my antenna when not in use. What's thea general thinking on this?

Cheers

Well I was recently the victim of an electrostatic discharge due to a nearby strike.
I lost several radios that were grounded to the ground system and not directly attached to an antenna lead and attached to a grounding antenna switch but they were switched off.

I lost a dual band vertical, a tm733a, ft757gx and matching antenna tuner, ft-690rII, satellite recevier, astron power supply, am/fm stereo receiver in the garage, and dsl modem thus far as I know.

Nowthing was visibly damaged except for the antenna and the factory installed smoke that was release from my sherwood receiver. The kenwood dual band will not power on. The 690 is deaf and mute (no receive or transmit), the 757 powers up but no display, the antenna tuner goes into a funky mode. Luckly my ts-520s, 706mkIIg, ic505, and acouple of other rigs were totally disconnected and did not suffer any damage. The dsl modem was on a standalone UPS and must have take the hit via the phone line. The sat receiver was on a surge protecter with the inputs running through the surge protector as well....I can't find my receipt for it though.

I know people that have had radios in a closet that were zapped because the direct hit went though wires in the wall in the back of the closet.

In the future all radios will be disconnected from power, antenna, and grounding unless in use.
I will have one storm radio in use with an attic antenna with battery power during skywarn nets.

It is not a matter of if we will get a lightning strike but a matter of when and how close.

Bill, Paul and Raleigh,

Many thanks for your contributions. I continue to learn everyday. From now on I will be altering my operating procedures - better to take every precaution possible. Many years ago my house took a derect hit and man, the result was not pretty. Blew away two inner brick walls and ripped straight through the others by making 3 foot diametre holes! The lightening travelled along the wiring in the walls from switch to switch leaving a blackened trail of destruction. The house was earthed too. That was long before I became an amateur but I remain scared of electric storms.

Thanks for your help, fellas.

Ditto !!

Mine was a small feeder or a static discharge and I am still finding things that aren't quite right.
I am looking at re-arranging my shack for better wiring/grounding. It will be a weekend or three project unto itself. Plus I am looking at storms again this weekend.

1418. Tune Up Methods

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-03-13 03:57:39 UTC
From: DW
Topic: 1418 Message: 1418

Hi all,

I've noticed that a substantial number of the postings here are in reference to a proper tune up procedure.

I just took a peek at the files section, and there's nothing re: the 520 or 820, only the 830.

I do understand that you experienced Elmers are busy, as Bill recently said, two jobs, but it might be very helpful if someone put together a proper, easy to understand procedure in the files section.

Thanks much, for this & all the other info. Also, thanks Bill for one of the best lists that I've ever seen.

BTW, I'm currently about two weeks behind on my e-mails, so if someone answers & I don't get right back to you, you know why.

TNX again!!

From: Bill K0ZL
Topic: 1418 Message: 1419

I am not the only one that is busy, eh? hi!

Actually, the tune up procedure is exactly the same
for all the hybrid rigs; whatever method you use that
works, will work on all of them.

there are several methods to tuning up that are both
safe and effective...

You have started a good thread on the subject; if
there is a way we can write a "generic" tune up
procedure that would fit all rigs, I would be glad to
put it together and make a .PDF file out of it for the
group. Again, the only challenge is to properly
identify each control as they are labeled for the
different models. We could also share with the Yaesu
groups as again, the tune up process is the same.

Actually, I am sure there is a tune-up guide for the 820 in the files section because I wrote it and uploaded it! Bill, if you have PDF versions of all the manuals you might talk me into doing a master guide to all the rigs with customized text for each model. Since my antenna is down at the moment and the weather is not suitable for climbing up on the roof . . . well, I have a bit of time on my hands.

OK Jim... I will look in the FILES section. I was
pretty sure someone had already done this.

Actually the owners' manuals are usually not too far
off the mark...

Hi,

I keep a photocopy of page #22 in a page protector
and the band plan in another near the radios.

I remember Drive Plate Load and that is it.

Here is a good link for tune up procedure

http://www.qsl.net/ab8pv/520.htm

1423. Kenwood HC-10 clock

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-03-14 02:21:06 UTC
From: kf0hr
Topic: 1423 Message: 1423

Hi all, I just picked up a KNWD HC-10 clock at the ham fest today.

Looking for a manual and the battery back up mod? I prograamed the clock and when I unplug the clock I loose everything?????? Pulled the bottom cover off to peek inside and there is no battery?

I took a look on ebay for a manual and saw an add for a HC-10 clock that has a 9 volt battery mod? can anyone help me?

thanks,
Teran KFØHR in North Dakota

1424. Kenwood HC-10 clock

Yahoo group: TS-520_820_530_830 (2001 — 2004)

Hi all,

Was at the Fargo ND ham fest today and found a nice KNWD HC-10 clock for in the shack. I have most of the buttons figgered out but would like to get a manual. Anyone know where I can down load a copy or find one? Maybe some one would scan and email me one.

Thanks,
Teran KFØHR in North Dakota

1425. Service Manuals from Manualman.com

Yahoo group: TS-520_820_530_830 (2001 — 2004)

Hi,

Has anyone in the group ever purchased a manual from manualman.com?
I'm thinking about getting a service manual for my 530SP and wonder
about their products. I have used W7FG in the past and know their
product.

Tks,

Van,
K0KAV

I have a 6mb file which covers all the 530 range if you have
somewhere tosend it too.

I also have a contact in France who may be able to send it.'

thomas99@...

He may be able to place it on a FTP site.

*** Bill you may be interested in this one.

Regards
Bob M.

Van,

I have purchased manuals from the manualman, and his copies are fantastic. He takes a lot of time and care to reproduce the full sized schematics, and to be sure that the contrast is good on the PCB photos, etc. You won't be disappointed.

+=========================+=================================+

DO TUBE-TYPE TRANSCEIVERS STILL HAVE A PLACE IN HAM RADIO?
By Robert Bacharach WA2EMF 9/27/2001

PROBLEM:

Many newly-minted amateurs whether young or old want to operate on HF with effective equipment, but in today's difficult economic times are unable to afford the newer equipment that is available.

SOLUTION:

Available on the USED-GEAR MARKET are many transceivers that have established VERY FINE PERFORMANCE RECORDS.
These include, but are not limited to: Kenwood TS-520S/SE, TS-530S, TS-820S, TS-830S; YAESU FT101/E/X, FT-901, FT902.

FEATURES OF THESE RIGS INCLUDE:

- Built-in AC Supplies / Some also come with DC Standard
- All Solid-State Except for Driver and Final Amplifier Stages
- Excellent Receiver Sensitivity: .25microvolt S+N/N 10 db or better
- Good to Excellent Selectivity:
- Excellent SSB Filters
- IF Shift
- Variable Bandpass Tuning
- Notch Filters
- 100 Watt Plus Transmitters on 160 thru 10 Meters
- (some have all WARC bands)
- CW/USB/LSB Modes (KNWD=EXCELLENT AUDIO)
- Capable of RTTY and other HF Digital modes
- TUBE FINALS MORE TOLERANT TO IMPEDANCE MIGRATIONS OF ANTENNA SYSTEM
- Reliable, rugged, long life rigs:
- Some running 25 years or more without tube changes or repairs of any kind: BATTLESHIP CONSTRUCTION
- LOW PRICE FOR FEATURES: $250 TO $500 USUALLY
- NOTE: TS820/TS830 WERE KENWOODS TOP-OF-THE-LINE

HOW TO GET ONE:
- BUY ONE LOCALLY FROM HAM YOU KNOW (TRY IT OUT)
- TAKE ELMER TO FLEE MARKET TO HELP EXAMINE RIG

- INTERNET AUCTIONS: RISKY BUT CAN GET GOOD GEAR

NOW . How do you tune up your new tube-type rig? See Below!
TUNE-UP PROCEDURE FOR TUBE-FINAL RIG: TS-520S

1. ATTACH 50 OHM DUMMY LOAD OR 50 OHM ANTENNA (LESS THAN 2:1
SWR) BEFORE MAKING ADJUSTMENTS

2. SET TRANSCEIVER FREQUENCY BAND AND BAND SEGMENT
- IF ANTENNA USED: TUNE TO CLEAR FREQUENCY

3. CHECK PLATE IDLING CURRENT: BIAS ADJUST
- MODE SWITCH TO USB
- METER SWITCH TO IP (CURRENT)
- STANDBY SWITCH TO SEND
- CHECK IDLING CURRENT OF 60 ma
- IF NOT 60 ma ADJUST BIAS CONTROL (SIDE PANEL)
- IF CURRENT >60 ma DO NOT REMAIN IN "SEND" POSITION FOR MORE
THAN A FEW SECONDS. EXCESSIVE PLATE CURRENT SHORTENS LIFE OF FINAL
AMPLIFIER TUBES
- RETURN STANDBY SWITCH TO REC

4. DRIVE TUNING
- CAR CONTROL COUNTER CLOCKWISE
- METER SWITCH TO ALC
- MODE SWITCH TO TUNE
- STANDBY SWITCH TO SEND
- PEAK ALC READING (MAX DEFLECTION) USING DRIVE CONTROL
- IF NO ALC READING: INCREASE CAR CONTROL UNTIL PRESENT
- RETURN STANDBY SWITCH TO REC

5. PLATE TUNING
- METER SWITCH TO IP
- MODE SWITCH TO TUNE
- TUNE POSITION PERMITS TUNING OF FINAL TANK CIRCUIT AT
REDUCED POWER WITHOUT DANGER TO TUBES
- STANDBY SWITCH TO SEND
- QUICKLY ADJUST PLATE CONTROL FOR DIP (MINIMUM CURRENT)
- RETURN STANDBY SWITCH TO REC
- F I N A L T U N E □ U P PROCEDURE FOR HIGH POWER:
- MODE SWITCH TO CW
- METER SWITCH TO RF
- STANDBY SWITCH TO SEND
- ALTERNATE FOLLOWING ADJUSTMENTS:
- LOAD CONTROL: PEAK (MAXIMUM DEFLECTION)
- PLATE CONTROL: PEAK (MAXIMUM DEFLECTION)
- RETURN STANDBY SWITCH TO REC
- CHECK PLATE CURRENT (IP) BETWEEN 200 AND 250 ma
-
6. RIG IS NOW PROPERLY TUNED: SET MODE AS DESIRED AND GO!

1438. Re: [TS-520_820_530_830] Re: Tune Up Methods

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-03-15 17:07:02 UTC
From: Peter A Markavage
Topic: 1418 Message: 1438

Although the tune for maximum output (using plate and load controls) after the initial adjustment of dip using the plate control, simple and easy, one should be aware that this procedure will not always tune or keep the plate tank circuit to resonance. At higher frequencies, 10 or 15 meters, a tune for maximum output will almost always result in the tank circuit (due to L and C values) not being in 100% resonance at the frequency of operation. Aging final tubes and improper neutralization will also skew the resonance point further. Being "off resonance" in the tank circuit can result in additional stress in the tubes, higher RF currents in the tank circuit components, additional heat energy being generated, and the possibly of spurious emissions. The last thing you should do, after tuning for maximum output, is to return the meter to the IP position and check and/or adjust the plate control for the "final dip" or resonance point. Any power output reduction (minimal at most) will go unnoticed when working another station.

1439. SP-820 Speaker

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-03-16 23:55:05 UTC
From: g0ihk
Topic: 1439 Message: 1439

Hi All,

Do any of the members of this group have an SP-820 speaker "lurking"
in the back of a cupboard/shelf? I recently purchased a "cosmetically
challenged" TS-820 that still works great and I would really like to
get the matching speaker for it. Looks are not too important as long
as it works OK. If you have one up for "grabs", email me at
g0ihk@... (no "*"s) with a price including shipping and
handling to the UK.

Cheers - Ian.

1440. TS-820S digital display problem

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-03-17 16:11:24 UTC
From: José Pedro Alvarez
Topic: 1440 Message: 1440

Hello all,

My 820 is having the following problems:

1.- When I'm in the process of tuning up, while transmitting on CW adjusting for max power, the digital display goes wild and start changing frequencies very fast. All goes normal when I switch back to receive. This doesn't happen when transmitting on SSB. I guess it may a problem of RF feedback to the rig, but would appreciate any ideas.

2.- Sometimes, usually when I just power up the rig, but sometines after it has been on for a while, the first digit of the display changes to 9, whatever the band the rig is on. On other times the first digit starts changing 9, 0, 1, and after a while the display returns to normal. There is no change in the receiving frequency.

Thanks for the help.

Jose Pedro CA3RVF
Santiago, Chile

1441. 820 finals

I read back through all post on installing new finals, still a bit confused.

neutrilize if you only replace the 12by7? That is what I want to attack first.

If not the most straight stuff for replacing in an 820. Not interested in the qro mods

1442. Re: [TS-520_820_530_830] 820 finals

I don't neutralize drivers. There is no adjustment for
that. If a tube doesn't work in one rig, I shelve it
and use another.

You only neutralize finals (6146) if they need it.

From: pchapman9202003
Topic: 1444 Message: 1444

Not looking for a shortcut that creates a problem, but my 820 finals are starting to show about 95 watts out instead of the 110 to 115 that they used to, so 2 questions

1. Should I replace the driver, 12by7, and does it require any thing other than just replacement?

2. Is there a more simple way to neutralize if I do go the final route than what I have read elsewhere?

1445. Re: [TS-520_820_530_830] 820 finals

That would bring me to my question. When would they need it? Why is it done? I have an old TS530 that stopped working a year or so ago and just have not had the time to tinker with it. I have four or five new 6146 and a couple of new 12BY7 and I am curious about what I have to do with them when I do get to tinker with the rig.

Nobody at the other end is going to notice a 15 or 20 watt reduction, if that's truly the case, in your power output. Maybe your line voltage was lower than "normal" when you took the measurement. I replace my finals and/or driver when they burn out, glow bright red, or only put out some small amount of RF. Neutralization of the final, if you need to do it, is simple if you follow the instructions in the manual.

When I bought my TS-820S, the frequency display was completely dead. I followed the Kenwood Service Bulletin on this problem (remove the counter unit, disassemble, clean pins and earth points, reassemble) and it worked great. I am completely non-technical regards radio, so was absolutely amazed when it worked!

Ian (G0IHK).

Yes, that is the procedure and everytime I have a problem I repeat the procedure being careful not to make additional problems and you will be supprised out many times some poor connection somewhere fixes the problem. I have also found pins on the boards that the connectors slide on to have a loose trace and by reheating them that solves the problem. Check the point with a meter when do to make sure the connection is good. Measure from the pin to some other point on the board. Be very careful if you heat the trace you don't lift the trace or bridge the pins.

Good Luck,

Bob WA6OJJ

From: Bill K0ZL
Topic: 1441 Message: 1450

First, try not to mix and match manufacturers when putting in tubes. Make them both GE or whatever, just don't mix them... makes it hard to neutralize them.

Why neutralize?

A grid-driven amplifier has many tube parameters that contribute to instability, among them is the grid-to-plate capacitance. We use tetrodes or pentodes instead of triodes in grid-driven amps to minimize this and make it easier to neutralize.

Grid to plate capacitance causes positive feedback inside the tube; this upsets the applecart in favor of unwanted energy being developed and transmitted.

Neutralization cancels this parameter, somewhat, and is made variable by way of the neutralizing capacitor to account for the different tubes we put in. Each set of tubes will have different grid-to-plate (Cgp) values, so the neutralizing cap must be adjustable.

To tell if your radio needs adjusting, tune for max smoke into a dummy load on 20M (or 10M if that is your favorite band). Observe the plate current "dip" as you tune thru resonance; does the RF output of the rig coincide with the plate current dip, or nearly so? Then you are ok.

If the max RF out (using an external wattmeter or even a CB type bridge will help here, place it right on top of the rig over the rig plate current meter) does NOT coincide with plate current dip, the neutralizing cap is adjusted CAREFULLY until it does, or as close as you can get with it.

Please use caution and an insulated screwdriver; NOT one of those black "antistatic" adjustment tools from Rat Shack; the neutralizing cap rotor has very high voltage on it. The black tools are CONDUCTIVE, boss.

From: Bill K0ZL
Topic: 1444 Message: 1451

In Tune mode, max the ALC reading using the
preselector or drive tune control. Keep on scale with
CAR.

unkey and let the tubes cool a bit.

Key again, and watch the ALC indication. If it starts
to drop off rapidly after keying up, the driver tube
is failing.

If not, it's ok.

You may just need an alignement.

Key to this is, at the lower power output, are you
still getting good ALC action with normal mic gains?

On the higher bands, a fresh set of finals will often
fix you right up. At today's prices however, it would
pay to wait until output drops to 75 watts. 110 to 95
is unnoticeable on the other end.

bill

Applies to all rigs in this series.

That's why I created one group for all four...
electrically they share a lot of stuff.

Thanks Bill always better safe than sorry. Situation is not really bad, showing 95-100 watts out on the 949E tuner with swr of about 1.3 or better tuned out on a G5RV, but have no idea how long the driver has been in this rig. I had such good luck after finding a perfect replacement for the TR relay, might as well keep going. Yes they are still out there, and brand new for under ten bucks. I bought a couple

An incompatible 12BY7 will show instability as the
driver or preselect tuning is rotated through
resonance... the plate current will show to be erratic
on the finals with a 'bad' 12BY7... if you ever see
that, swap the tube out but don't throw the old one.
It may work just fine in another rig!

Best 12BY7's are used, with the 'EDGE' worn off them;
or the matched pairs used in the old Tek scopes; scads
of those around, they make great radio tubes. They
were selected for matched characteristics for the
scopes rather than gain.

Topic: 1458 Message: 1458

Hello to the group. My name is Bill, call is N5CCQ and I am new to HF. Got licensed about 25 years ago but stayed on 2 meter, then was out of the hobby for many years. Bought a TS-520 off of e-bay at a price I figured at least it would be a parts rig, boy was I surprised. Just plugged it in for a smoke test and I cant discribe how pleased I am with the receive audio. The only other HF rig I have listen to is my Yaesu FT-77 and this old Kenwood has it beat hands down. Its hooked to a 135 ft dipole up about 30ft. will not try transmit untill I have the chance to read the manual but from reading the messages here I thought I read something about needing a jumper wire in the vfo plug on back?? is that right? Figure I will learn on this one as it will not win any beauty contest then start looking for a TS-830. Sorry to get long winded but had to tell someone how great this rig sounds, but of course you guys already know that.....

73 got to get back to checking out this TS-520
Bill N5CCQ

Topic: 1458 Message: 1459

Welcome to the group Bill. These rigs were designed to work either as stand-alone rigs, with an external VFO, or with a matching receiver. The reason you would want two VFO's is the ability to work split frequency QSO's. The interface to the external VFO or receiver was accomplished with a cable that inserted into a nine-pin mini-tube socket on the back of the rig. If you do not have the external VFO, then there is a dummy plug that gets inserted into the socket instead.

The dummy plug is round, black, and about 3/8" inch thick. Just look at your manual and find the location of the VFO socket, if the socket is empty you need to get a VFO plug. If there is something in there, you are probably good to go. Dummy plugs are still available from Kenwood Parts if you need one (about $5 as I recall), but they are a bear to solder. I have also seen creative homebrew solutions that work just as well. My first 820S came with just a piece of wire wrapped over a piece of cardboard and it worked the whole time I had the rig.

73 and good luck,
Jim K1ZC

thanks for the info. I dont have the external vfo, have seen them for sale at various prices. I am in my work week now and wont get a chance to check it out more until thusday, I know there are two sockets in the back and one has the plug in it but will check and make sure that is the external vfo socket. down loaded a manual for a TS-520S is there any difference in that and the TS-520 when it comes to tune up instructions?

thanks
Bill

Bill,

The tune-up procedure is quite similar on all the rigs in this series. I am not sure about the 520's, but I think the only difference between the 820S and 820 is that the "S" had a digital frequency display in addition to the analog dial.

As for the plug, I suspect you have what you need as I am not aware of any other socket that would take a plug. Good luck with it.

73,
Jim

newer is not necessarily better.

You should give a listen to a TS-850 however, when you get a chance. Using an external speaker, the 850 sounds as good as the older rigs. Doesn't have that "synth" sound whether sitting still on a signal or tuning around.

And there is no receive without the plug, unless you have the external
VFO.

I have a 430s and an 820s...
The 430 has some nice features, but I always end up
turning the 820 on when I get to the shack. Told someone
else the other night the same thing actually, I just like the
sound of that 820 better...

1470. Kenwood TS-530S

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-03-24 02:22:57 UTC
From: kf0hr
Topic: 1470 Message: 1470

Hi all, I have an TS-530S after a few years of no use.
Cleaned and tuned up the rig. All seemes to work fine but for one thing. Stations report that I am always a little off frequency. Not much but enough for the other station make a comment about it.

Any help on what can be done to as to say zero beat the receiver with the transmiter so they will be on the same frequency?
I looked in the manual and found no help.

So thought I would give this a try on here.

Thanks,
Terry KFØHR in North Dakota

Hi do not know if there is a permanent fix but i have the same trouble mine being 2kcs off. So i use the rit control to recieve so when i transmit i am on the other stations frequency hope that helps until you find a permanent answer . When you do please let me know. All the best from Nigel M0dbo

I can't remember convergence as being a normal
alignment issue, as it is on the Yaesu 101 series...

I suppose your RIT is truly OFF... that is, when the
RIT is turned off, the rit control has no effect.

Hi Bill,

Checked the RIT just to be sure. It shuts off.
I am thinking that a cap or resister may have
changed and is pulling the receive or transmit?
By using the RIT all the time gets around it.
Just thought I would ask around to get the easy
fix for my trusty old TS-530S.

Thanks Teran KF?HR

Fascinating. My TS-520 has a similar situation -- the dial reads 2kHz
lower than it should, based on today's "noontime net".

Nigel> So i use the rit control to recieve so when i transmit i am on
Nigel> the other stations frequency hope that helps until you find a
Nigel> permanent answer . When you do please let me know. All the best
Nigel> from Nigel

I'm not sure on my rig whether this happens evenly across all bands or
if it increases or decreases when I move up or down inside bands or on
other bands, as I only have the single data point. I've almost
assembled the necessary tools to properly maintain the rig and that's
one of the bugs I hope to work out.

Jack.

Have a good working TS-830S.

Please reply direct

Works great, GE 6146B finals, 150W out, 140W on 10M.

Wiill include the manual and tech docs on CD.

This was my main rig till last summer, When I got a new radio.

High serial number, Most of the mods for stability and such appear
to be done by the factory.

Before me the radio had been used by an off bander, All those pll
mods were pulled and the functions returned to factory specs. I was
the one to cut the wire to enable the WARC Bands.

Face is good, Case in good condition, but some rusting of the
screws near the speaker and was dented once but straightend out.

Pictures available.

$350 USPS Money Order, Shipped CONUS.

Thanks

1476. Power discoveries and 60Hz buzz

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-03-26 13:37:21 UTC
From: Jack Twilley
Topic: 1476 Message: 1476

I disassembled my station to treat it with contact cleaner when I received a bit of a shock. Turns out that my DC power supply, even turned off, is at 120VAC potential with respect to the "real" ground (heavy wire connected to cold water pipe just after it exits the ground). I checked the outlet and here's what I measured:

Hot-White 110V
Hot-Green 55V
Hot-Real 115V
White-Green 55V
White-Real 0V, continuity
Green-Real 55V

Where "real" is the aforementioned real ground, and hot, white and green are the short, tall and ground sockets of the outlet.

This seems wrong, but I'm no professional when it comes to residential power, so I don't really know what to expect. The house has a lot of the original two-wire wiring from the 1940s and the occasional section of three-wire wiring like this patch.

When I reconnected my receiver, I noticed heavy 60Hz buzz. I don't know if it's from the contact cleaner somehow or what, and I don't remember whether I heard it before I disassembled the radio for cleaning.

What's the proper next step to take? I'm unemployed and I don't want to provoke my landlady into raising the rent, so I don't want to involve any professional electricians unless it's absolutely necessary, but if this is a health-and-safety issue, I'll get right on it, damn the expense.

Jack.

Jack, I am not an electrician but if I understand what you are describing correctly there is someting wrong. At an a/c outlet you should be able to measure 110v from ground to hot, 0v from neutral to ground and 110v from hot to neutral. It almost sounds like your ground and neutral lines are floating and not connected to ground. If you are not knowlegable with troubleshooting this type of problem then I would contact an electrican as these are lethal voltages.

1478. VFO Fix?

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-03-25 01:19:15 UTC
From: John M. Trindle
Topic: 1478 Message: 1478

Hello, folks, I'm new to your list.

My TS-520S has developed a flaky internal VFO. When I dial any frequency above about 200KHz into any given band, the tuning jumps around radically. I can eventually tweak it on-frequency but it's really a pain.

Is there any easy repair, cleaning or reseating connectors, that I can attempt on my own before CQ WPX this weekend?

Thanks for any help!

Jack, take a look in your breaker box, you may just
have some loose neutral (white) and ground (bare)
wires on the busses with all the screws. Tighten them
up.

We don't have breakers here, just four 30A fuses. The box is in the
wall instead of on the wall like other places I've lived, so it's not
really accessible in that way.

Try touching up VR-5 on the IF unit; looks like that
might have something to do with converging RIT and XIT
with the switch off maybe.

You were very very close, though. :-) It turns out that I had my
radio equipment and my computer UPS both plugged into the same outlet
and that outlet had a floating ground. I fixed the ground, and
everything's much better.

I did discover something interesting immediately after correcting this
condition, though, which pertains directly to my HF rig and is thus
on-topic. :-)

I thought I'd try using headphones. When on DC power, I hear a harsh
60Hz buzz over the headphones that I don't notice/hear on speaker.
When on AC power, the buzz goes away. Also, when on DC power, my
TNC's STA light will stay on when I hold down my code key. When on AC
power, it just flickers very briefly as I press down the key.

I also get way more power on AC than on DC, but that's no real
surprise, I'm sure. Any thoughts on the headphones or the light?

hi jack,

I gave my pro electrician friend a call but he was out tonight,
will check with him saturday on your problem.
(He won't send you a bill!)

Is this the only outlet in your home/apt that has this problem
or are other outlets that give the same readings ?

To help find problems, you can buy for a few dollars an outlet
tester at local home center home depot, lowes, menards etc.
and this only works on three prong outlets. It will tell you
if there is a problem.

If landlady give you hard time, just tell her you got
shocked and knocked on your back and almost got killed !

Or if she is nice to you, perhaps you can split the bill with her.

The building you are in could also have a problem or even at the
main panel for the building or out at the power company connection.

As other group member posted, be careful and don't get hurt.

james

Hi group.
I was curious as to what mics folks are using on their TS-830S's. I have a Heil Goldline on it now and seem to get good reports on stateside but on DX the HC-5 element is better. Any info is appreciated.

Topic: 1478 Message: 1485

It's not particularly easy, but remove the VFO from
the rig and clean the wiper connection at the back of
the air variable capactor. It's dirty and that is what
is causing the problem. Use a good contact cleaner,
such as Cailube MCL or DEOXIT.

Remember to put the 3 flat washers back on the rear
stud before putting the cover back on.

You can leave the VFO hanging loose, plug it in, turn
on your calibrator and run the VFO from one end to the
other to make sure you have fixed the problem; if the
vfo is dirty, the calibrator will sound dirty as you
"swoop" past the markers.

I think there may be a ground loop inside the rig that
is allowing some hash from the DC-DC converter to show
up on the audio output on the fones.

I seem to remember the same phenom on my ft-101 when I
was running it in my Caddy hearse back in the 70's...
long time ago!

TNX for all of the input. Seems a lot of ops like the Shure 444. That used to be a good one back in the day on the FT-101 series as well. I have to agree with the one fellow that called it the ugliest piece of plastic ever seen.

Not only ugly but it makes funny squeaking noises when
you push the PTT bar... hi! totally retro.

1492. Ringing Filters

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-03-29 18:56:57 UTC
From: Jim
Topic: 1492 Message: 1492

Am I correct in thinking that ringing is determined mainly by the shape of the filter? My R-820 has all the optional filters, and some of them REALLY ring, while others are nice and quiet. It seems to be more pronounced on the CW filters (150-500Hz) than on the SSB filter.

Anything the operator can do to reduce the effect?

73,
Jim

1493. Re: [TS-520_820_530_830] Ringing Filters

From: Bill K0ZL
Topic: 1492 Message: 1493

Narrower filters will ring more.

Make sure you hear it on headphones; some speaker/room combos will "ring" regardless of filters. And if you were a wartime artillery crewman, forget it... hi

Start by reducing your RF gain control. I run mine so the meter hangs around S9. I can still hear the weak ones but I am not pounding my IF to death.

Second, align the coils on either side of the CW filter for the most pleasing note, using a weak steady signal. As you run past the matching impedance of the filter by turning each coil, you will notice a "swooping" effect.. try to stop turning the coil in the middle of the "swoop". Then try the same exact listening arrangement with the new alignment, see what you think.

1495. VFO-230 Interconnect Cable (E30-1672--5) Availability

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-03-30 23:14:10 UTC
From: kzerokav
Topic: 1495 Message: 1495

Anyone know whether Kenwood (or someone) carries this interconnect cable. Just bought a nice VFO-230 to use with my TS-530SP and it was absent the cable. Anyone know the number for Kenwood Parts?

Thanks for any help.

Van,
K0KAV

1496. VFO-230 Interconnect Cable

Yahoo group: TS-520_820_530_830 (2001 — 2004)

Not having an interconnect cable for my TS-530SP/VFO-230 and anxious to hook 'em up; I thought, heck, I'll just run over to Radio Shack and grab a couple of 8 pin Dins and wire up a cable. Yeah, right! They just don't have much for hams anymore, not even male din connectors. I have a few 7 pin dins I used to use for KW gear to key amps and lotsa others but no 8's.

Now I'm wondering, does anyone out there happen to have the VFO-230 interconnect cable you're not using, or in your junk box or something like that. I sure would like to light this thing up.

Tks for any help, ideas, etc.

Van,
K0KAV

Check on the kenwood parts site
http://www.kenwoodparts.com/
That cable was disco'd, but they gave a second part number
which is not.

I did find out how to get ahold of them. That one has been discontinued but they have another part number which they call a "substitute cable." When I found out it was about $40 shipped, I decided to try and throw one together, then couldn't find any 8 pin dins locally so I thought I would try a few other avenues first.

Tks,
Van

hi,

http://www.packetradio.com/audio%20connectors.htm

Buck has the 8 pin din if you can't find them local.

Cable is straight connect 1-1 8-8 etc.

I built one using old shielded cable from modem

I sure hope this doesn't turn out to be the Screen Grid switch. Sounds suspicious to me. I was sure it was "ON", in fact, I flicked it back and forth a few times to make sure it was making good contact. Just now noticed it in the OFF position as I am taking off the bottom cover. Oh well. Will see when I put it back together.

Any other ideas welcomed.

Hi
Just got a TS 530s from a local ham.
The radio is very fine shape.
however I am looking for an istruction manual.
Is there one available online?
Does anyone have a PDf file they can email me?

I would also like to have the service manual.

Thanks

Bob never mind the message about the model number but
i have to wonder how hard you did look for it. I have
the manual for the vr-500 if you wish to email me off
list. It took all of .24 seconds to find.

I have three versions of the operators manual but that does NOT
include the CIRCUIT Diagram.

Keep Digging please Dawg...

1517. Using R-820 as an external VFO

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-04-03 02:13:25 UTC
From: Jim
Topic: 1517 Message: 1517

I have an R-820 that I want to use as an external VFO for my TS-820S. According to the documentation, I should be able to do this even without making the "full transceive" mods to the rig. My problem is that when I try to zero beat the two units, they still wind up far apart on frequency. I do OK when I switch the R-820 into RECV, transceive switch position, 25 Khz CAL switch on and zero beat to the TS-820, but when I try the next step which requires me to switch the R-820 into Tx mode and zero beat, it winds up far away from the TS-820 frequency.

I must be missing something here. Is there a similar zero beat procedure for those that use the external VFO? If so, maybe you can help walk me through it. Scratching my head here, and dandruff is bad for the rig. Before you ask, yes I switched the rear panel switch from "Full" to "VFO" mode.

73,
Jim

Hello All

Has anyone ever done a list of what boards are used in different models???

example If I have 530s and find a 530sp service manual is it

correct as far as IF board, RF Board etc.

Is the 530SP closer to an 830S as far as boards or closer to a

530S

In other words the question is do you have to get the correct

Service Manual for each?

Or do some over lap??

There is one service manual for the 530S/SP/D and another for the 830.

Actually there were two service manuals. The first one, issued in 1981
along with some service notes, just addressed the 530S, and the later
version issued in 1983, cover the S and the SP/D. This later version
detailed the Notch unit and several changes to the circuitry and the D
addressed the Korea market only.

1526. S-meter driving me nuts

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-04-04 21:17:21 UTC
From: Jim
Topic: 1526 Message: 1526

I am trying to figure out why my S-meter will not deflect and why the meter lamps burn so dimly. This is an R-820, but the circuit visually looks very similar to the TS-820. I relamped both rigs with identical lamps around Christmas, and the TS-820 looks and works great. The meter lamps (and the VFO lamp) is brightly illuminated and the S-meter deflects properly.

On the receiver, the lamp over the VFO is nice and bright, but the two lamps over the S-meter are dim. The light up, but don't get the job done. The same terminal strip feeds both the VFO lamp and the meter lamps so I am confused as to why the meter behaves that way when the VFO does not. The lamps are supposed to be 12v 60ma, and the voltage on the terminal strip reads 11v. From what I can see on the schematic, there is nothing else connected into that part of the circuit. The 15 ohm resistor is good and reads spot-on 15.

The meter is just an S-meter in this receiver. The schematic shows the positive going to a 11-pin connector on the IF-A unit, other side to ground. I THINK I found the corresponding connector and reseated it just to be sure (lots of white wires in that harness).

The only clue I have is that when the meter does decide to work a bit, as a CW signal comes in, the meter lamps brighten and dim with the signal. You can watch somebody call CQ! Am I right in thinking that something is drawing excess current, hence the funny behavior? I visually checked for some things, like a bare wire touching the chassis or a short, but did not see anything that simple. The rig does receive most of the time, but on one or two occassions I have heard a nasty sound, almost like the broadband noise from those BPL trials, that goes away if I power off and power on again.

Am I on the right track? Can anybody:

A. Make a suggestion of where to look next?
B. Supply a more readable version of the schematic or service manual? I downloaded one from the German mods site, but the resolution is somewhat poor.

73,
Jim

Bill,

I don't know, how would I go about checking how the 12v is regulated? My test equipment consists of the humble multimeter, but nothing else. I thought measuring the voltage across the terminal strip would suffice, but maybe there is something I am missing?

I find it strange that the VFO lamp and the meter lamps are fed off the exact same terminal strip, yet the VFO lamp does not exhibit this behavior/

I think you can get to the terminal strip that has the
red wires on it for the meter lamps...

If they are too dim, could be that someone replaced
them with some that draw too little current to be
bright enough for ya.

You could also have two separate problems. First
check when t'shooting AGC or ALC problems is to make
sure that all the low voltage regulators are working.
All you need for that is (drum roll) a simple DVM and
the schematic, and someone to help you find what to
check. That's free.

Bill & Bob,

Thanks for the suggestions. I am sure the lamps are OK because I relamped both my TS-820 and R-820 over the Christmas holidays so I know exactly what lamps are in there. All six are identical and all are to factory spec.

I will check the grounds as Bob suggested, but I will have to find somebody to help with the low voltage regulators. Fortunately, I have a buddy that is a whiz at this stuff, knows his way around a schematic, and he even has a proper workbench.

My TS530S, receives and transmits on 10mhz all the way up to 10M
with fairly close to new spec'ed power out for those bands.

On 40M and below it is stone dead in terms of output. No amount of
tuning, dipping or drive, gives any inkling of output power on 40 or
80.

Any ideas, why the partial death of my TS-530S?

The simplist of problems.....Dirty bandswtich....I noticed
80M seemed to pop to life when playing around with it with live
outdoor antenna instead of dummy load....Then switched the bands
switch through it's range a few times, went back to 40M, and could
load and tune fine.

Will be tearing down one weekend and putting a little CAIG cleaner
on all the controls..

Thanks for all the suggestions.

Mark,
I don't recommend spraying the bandswitch directly.
The fiber wafers could swell and cause the switch to
feel very tight.

I use a foam-tip applicator; soak it in the spray,
then apply to only the metal parts (as much as
possible) on the switch, then change bands and do it
again so you get all of the switch areas.

Also, look at the 1/4" shaft coupling just inside the
PA cage... it may be cracked. This will allow slop on
the bandswitch and sometimes cause some bands to fail.

1546. TS-520SE Transverter Connection

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-04-16 16:35:25 UTC
From: Brent Baum
Topic: 1546 Message: 1546

I appreciate KE4DRN for steering me to this group.

I own a TS-520SE and last week a friend gave me a TV-506 (6 meter transverter) to go with it. However, when Kenwood made the changes in the "S" to create the "SE" one of the features they dropped was the transverter connection. In comparing the schematics for the two models it appears that the appropriate junction points still exist on the circuit boards. It also appears that I will need to add a couple of RCA jacks, the rectangular transverter connector and a slide switch somewhere on the back of the chassis. The schematic for the "S" also shows a relay and some sort of choke in the IF (?) line that the "SE" doesn't have.

Also on my particular unit the previous owner installed CB crystals in the 10 meter slots, so I have to open it up to recrystal the poor beast anyway.

So questions:
1. Has anyone done this retrofit and have any guidance?
2. Is the IF choke really necessary?
3. Is the relay a separate unit or just another set of contacts on the regular T/R relay?

Any help and guidance in this project will be appreciated.

73 de KC5MEI, Heber City, UT

1547. ts-530 split nylon cogs.

Yahoo group: TS-520_820_530_830 (2001 — 2004)

Topic: 1547 Message: 1548

these are available, i will post the part number later
today.

Best to change them; even if not broken completely
they will introduce slop in the bandswitch that will
cause intermittant rx and tx power.

Hey these rigs ain't no sping chickens! hi.

As long as you are able to make ALC reading in TX and
it's not down below 75 watts, I would not worry;
however, get a set of tubes and keep them handy.

Many tubes are changed prematurely; and either a good
set of tubes is discarded, or a well-used set is left
on a shelf.

I like to see them used until they are DND (Darn Near
Dead); to get the most out of our limited tube-stock
these days.

Thankyou for your reply.I was just wondering if component failure in the pa
stage were failing.I have a spare set of matched valves,shall not use them
until ones in set are "knackered".
Hope you don't mind,but,are you familiar with the ts-120v.There is no drive
coming from the rf board,but there is very low level rf coming from the
switch ,the third one from the front of the set.Switches the band pass
filters into the pre driver stages.Ithink.

Bill,
just thought I'd let you know
My wife and I got our resultsm yesterday
poped into ACA today we now have our Numbers
and went onto a local 80mtr net and 2 mtrs tonight.

Ruth = VK4HEY
Bob = VK4HAY

Hey,Hay...

Next on to a Full Call

Regards
Bob M.

1557. Re: [TS-520_820_530_830] power drop/ts-530s

Yahoo group: TS-520_820_530_830 (2001 — 2004)

usual cause of low/no drive on the 120/130 series, if
on all bands, is a failure of one or more of the rf
filter switching diodes, or a lack of LO signal to one
of the mixers. Will take some troubleshooting to
determine which it is.

I have service info,I will have a go.
My son ,who is 12year old m3 will be happy if I get it going.He misses hf operating.I will say he is good ham operator even though he is only 12.Shows alot of the old timers up h hi.
Thanks
G7JHW

1561. Any Gotchas?

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-04-29 23:05:23 UTC
From: w0spy
Topic: 1561 Message: 1561

I have had TS-520 and the 599 Twins for several years. Have been looking at some of the rigs with digital readout on EBay. Does anyone know of any problems or gotchas with the following Kenwood rigs?
TS-130S
TS-430S
TS-530 SP
TS-690S with Tuner
TS-830
TS-830S

Thanks
Don

1562. Re: [TS-520_820_530_830] Any Gotchas?

I can't really advise you on those rigs having never
owned any of them. But you might want to have a look
at www.mods.dk and see the problems/mods for the
various rigs on your wish list. I believe you can
find rig reviews on www.eham.com as well (not sure
about that url).
Or you can do a google search on the rigs to see what
you find as well.

My $.02 listed below.
73,
Norm, W3IZ
www.w3iz.com
Does anyone
> know of any problems or gotchas with the following
> Kenwood rigs?
> TS-130S
Avoid at all cost. Drifts and has crummy rx
> TS-430S
Nice compact rig. Owned one when they were new and used it for a few years. RX was a bit tinny but that is my opinion. The rig is a fairly well put together unit. Not bad for a used rig if the price is right. Has 2 VFO's and a couple of memories, add a PS and your good to go. Likes resonant antennas
> TS-530 SP
Not bad, solid after warm up. Nice used rig for around $250
> TS-690S with Tuner
No experience

> TS-830
> TS-830S
Would recommend this rig. This was top of the line for many years. I still have one and the rx is very good, low noise floor and sensitive. It does have tube finals but that is a small trade off for superb audio and 120 watts tx and hot rx. Can be had on the used market for $350 - $400 in great condition.

Had 830-S, VFO-230, and SM220 as a station for years. Rate the 830 very high. Only problem was you need the external vfo to work split. The RIT only gives you +/- 2.5 kc to play with. Receiver is very hot especially if a cw filter is installed. Great rig! Only reason for giving it up is I wanted auto tune which I got with my TS570.

Dale,
I agree on the fact that you need the external VFO, which I have. But my TS-830 is a second(or 3rd, 4th) that I like to fool around with so split is not an issue. My main station is FT-1000MP & QRO Tech amp. Would you not rate the RX on the 830 better than the TS-570?

Had 830-S, VFO-230, and SM220 as a station for years. Rate the 830 very high. Only problem was you need the external vfo to work split. The RIT only gives you +/- 2.5 kc to play with. Receiver is very hot especially if a cw filter is installed. Great rig! Only reason for giving it up is I wanted auto tune which I got with my TS570.

Yes Norm.....the receiver in the 830 is the best I have ever heard. I am completely disappointed in the 570 receive compared to the 830, although is was the best I could afford at the time to get the AT feature. Would like to someday assemble the complete 830 line as a second station.

My humble opinion (and a lot of other people's) is that you could have done much better going with a used 850 than a 570, unless you have an aversion to used gear. Superb receive, fast and wide-ranging tuner, and selling for about $700.

TS-690S is a great rig. Have used one for over ten years with absolutley no problems. Has ability to implement various filters in BOTH IFs, like the TS-850 and the autotune (no 160M) accessory is great to have. Worked over 25 countries on 6M with it - barefoot and 3 element beam. Has most of the TS-850 features, but is not as good a receiver - as should be expected. The 850 is hard to beat .. period! 6M is a real blast and well deserves its "magic band" descriptor.

Have very high respect for the TS-830 and consider it to be the best of all the "hybrid" rigs. Great receiver and a step up on the 820, 520, 530 series.

TS-690 is definitely a large step up from the TS-430 in the solid state group. 430 has keyboard and other problems which are fixable - and are described at locations on the net.

finally got around to looking at my recently aquired TS-520, inside is fairly clean, blew the dust out and cleaned the switches. I am missing the vfo plug and have ordered one, however would like to know how the socket is numbered for determining location of pins 8 and 9. is it clockwise or counter clockwise from the gap in the socket? also for getting a replacement set of tubes is there a recommended parts place and what should I expect to pay? hope to get this old rig on the air soon.

Hi all, have been monitoring this list for a while but this is my first posting.
I have a TS530s with an AT230 tuner, in case your interested, all seems to be going fine.
The only problem I have is a rather large amount of VFO drift after switch on which will settle down after several hours. In fact after switch on you can tap the top of the set and get a jump op 2-3 100 hz and the side tone on CW is all over the show as well.
I have left the set on for several days now (leaving the heaters off) and is as steady as a rock now. When not using the set for normal TX/RX work it records weather faxes onto my PC, so it needs to be on most times anyway.
On some cold mornings when turned on from cold the display would read 14.000 (on 20 metres) for some time until warmed up, and no amount of knob twiddling would change this.
This display would change for different bands, but would be locked down the bottom of the band.
I guess this isn't so much of a problem now the rig is left on, but it may be a symptom of something greater.
Anybody have any ideas.

From outside the socket, count counterclockwise.

From the wiring side, inside the set, it's clockwise
from the key.

John your VFO most likely needs a good cleaning.
There are several posts on this in the archives; if
you cannot find them let us know.

On the PLL/counter display, could be just alignment
issue of the VCO loop (the counter is actually
displaying a "tracking" signal developed by the VCO
from the VFO signal), or based on the temp issues it
could be a bad solder joint around the low voltage
regulator.

Also, check the bandswitch coupling, the white or
brown plastic piece on the bandswitch shaft, just
inside the PA enclosure. If there are cracks around
the setscrew holes, it will need to be replaced. This
can cause the bandswitch to index improperly, and
cause all sorts of problems.

Hi,

Has anyone had any experience using the Lo Impedance MC-30S
with the 530 series transceivers? It is listed as an option along
with the MC-35S (Hi impedance)and others. I'm currently using the
MC-50 but I like a fist mic now and then.

Tks for any replies.

Van,
K0KAV

1578. TS-520 Dead on 80 & 15 meters

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-05-05 02:14:53 UTC
From: ka8fan
Topic: 1578 Message: 1578

Hello,

Having owned a TS-520 since 1980, it only seemed fitting that I volunteer to repair one that a friend bought from our radio club. It has been used over the years primarily for Field Day, and has worked well. Last year, however, the rig did not work on 80 meters (rx or tx). After I got it on the bench, I found that it also does not work on 15.

I started going through the alignment procedure and quickly found that I could not get any output on those bands from the hetrodyne oscillator. The tuning slugs turned just fine (sometimes they freeze inside the sleeve, and then crumble when too much force is applied. I checked the board's solder connections ok, and cleaned and verified the bandswitch.

Is it safe to conclude that the crystals for these particular bands have gone bad (do crystals go bad?)? If so, does anybody know of a good source?

I thank you all in advance for your helpful advice.

73,

Eric KA8FAN

1579. Runaway Freq Counter

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-05-04 14:21:48 UTC
From: chrishosman
Topic: 1579 Message: 1579

Lately when I turn on my 820, the freq counter starts counting in the 1 MHz region and rapidly counts up to the freq setting on the dial. Is this an indicator that a tube is going bad? I'm also experiencing a problem where I takes quite a long warm up period before I can tune the radio to a reasonable SWR.

Thanks.

I just received - Get this --- A brand new in the box Kenwood TS-820s. This rig was never put on the air and I just can't believe I got it. Story on it, buyer received unit, died, widow put it in the closet for 30 years. From it's condition, I truly beleive it. Spotless, and shiny metal even the tubes, no dirt - nothing. Powered right up except for the SG switch in the back which gave me a heart attack at first when I had no idling current.

Original box, warranty card, everthing else. The tubes, the internals, everything, not a speck of dust, dirt, scratches etc.

$ 500.00 got it. Now, what do I do with the other 3 820s?

hi Eric,

Take a look inside and verify the nylon gears are not slipping on
the shafts. Sometimes they get stress cracks and slip.

Then give the bandswitches a good cleaning with Deoxit, just a small
drop is all you need on the contact. Avoid any fluid on the wafers.
The Deoxit is also good on the tube pins.

You can also use the deoxit on the pots and all switches, makes them
smooth and gets rid of the pop and scratch noise.

A few drops of light oil for the cooling fan bearing is a good idea too.

Could be the previous owner(s) only worked some of the bands.

The radio does not receive or transmit on 80 and 15 meters. It transmits and receives fine on 40, 20, and all of the 10-meter ranges. It receives ok on WWV.

Yep that will be a bad band crystal or oscillator. I
would change the osc. transistor first; that sometimes
wakes them up. Xtals are expensive, 20-25.00 each.

I cant believe anyone doesnt have a TS 530S owners manual and
service manual on file?
I need both for my outstanding TS 530s
If I obtain a copy of it I would certainly post it for others.
We all have to help each other

Thanks
Scott

They are available from www.manualman.com and are excellent digital
reproductions at a reasonable price. That's where I got mine.

I assume the transistor you suggested I replace first is Q1 on the RF board; Q2 is simply a buffer amp, isn't it?

Q6 if we are dealing with a TS-520S... its a fet.
2SK19 but a 2SK192 will also work.

In the TS-520 (not S) it is Q1, correct.

Also change C26, 10pF disk ceramic. Cheap one from rat
shack assortment should work fine.

They both have 160m. The SP has a variable notch where the RF Gain is, on
the 530S. There may well be other differences.

Van,
K0KAV

Hello all,
I am a new owner of an old TS-520SE and a new general class licence, and have been reading the postings with quite a lot of interest. I am not ready to ask all of my questions yet but I am trying to figure out how to tune the radio up. I can recieve signals from strong stations, the responses often get lost in noise that I hear on all bands and in all settings of my MFJ 949E tuner. I am using a HY Gain AV 18VS vertical antenna with a base loading coil and not as much grounding as I need (I suffer from boulders in the soil, and will probably end up installing counterpoise wires although the side yard I have it in is kind of small for the length of wire that I will need). I went to a large parking lot and tried out a 135 foot long wire all band dipole this afternoon (no grounding at all), still lots of noise.

I only get to play with it a few minutes at a time, and am not proficient at using it yet. I am sure that I will be coming back with how to and what does it mean kinds of questions.

Keith

I do not know about the 530s but the 530sp has the WRAC bands fitted and the manual states that it's out put is 220w pep ssb and 180w cw. For some reason the only bands i can get 180w out on are 18m and 12m most of the other bands it is 100 w.as another reply stated it has an if shift control. All the best from Nigel M0dbo

Hi Keith.
Welcome and congratulations on the upgrade. As a new ham the TS-520 should provide you with hours of operating pleasure. You should ahve no problem working DX, ragchewing or even checking into traffic nets with it. The most importan feature of any radio is it's antenna. The vertical that you have will work well for you but it does need ground radials. They do not have to be "tuned" or cut to a specific length but more of them is better than less. Of course if you can have a lot of long radials that is best but even if you only have 30 ft in witch to lay them you want to get at least 25 or 30 of them oput there all the same length. More short wires are better than a few long wires. All radials should be attached to a common poit at the base of the antenna and to the braid of the coax. An old stop sign works well. The purpose of the ground radials if for RF ground and this provides a return path for the current. The ground rod is for electrical (lightning) ground and will discharge static build up on the radiator. Also, if your yard has a metal fence, attach a ground radial(s) from the base to the fence then the fence acts as a couterpoise.
The radio needs to be grounded at the shack. Shack grounding is very important for safety and prevents RF interference (RFI). I'm not 100% familiar with the antenna you are using but I believe that you tune it by tapping the coils at the base. This is better than using your tuner in the shack. Try disconnecting the tuner inside. The TS-520 uses a Pi network in it's final stage and should be able to tune into various loads so having another network imediately following doesn't make much sense. Adjust the feedpoint of the antenna for best resonance.
Keep looking at your manual and follow the tune up procedures and you should be OK. Don't be afraid to ask any question here, no matter how insignificant you may think it is. You will only get good advice and you won't get flamed for asking. That's what these groups are for. Good luck and hope to catch you on the air. BTW what is your call?

Welcome Keith,

I to am a new call using a TS-530s Good units loverly tone.
You may hear me one day I'm From Australia.

There is a Tune Up Guide in the Files section.
it will guide you just remember to let it warm up a bit
so it will stabilise.

Have Fun Take care

If you are getting noise with an antenna connected, and then less noise with it disconnected, the receiver is probably OK. Band conditions can be bad enough to make you think the radio is not working or that you are doing something wrong. Good and bad band conditions have a 22 day cycle coinciding with solar activity (or the lack thereof). Also, if today is bad, tomorrow will not necessarily be much better; but next week will, most likely. So be patient and listen a lot, every day, and try different bands.

For instance, it could just be that this is Mother's Day, but not many sigs on 20M today and the ones that are on are very weak... no "s" meter reading with my preamp off which is rare. I am using a full-sized quad loop of wire which is about the best wire antenna for this band. Even 40 is dead, rare for this time of day on a weekend.

1609. QRP for TS520SE

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-05-08 20:15:41 UTC
From: othello159
Topic: 1609 Message: 1609

I recently got the TS 520SE and I am still figuring out details.
My interest is in QRP CW and while I do not object running the radio in "enhanced QRP mode", eg 160 watts, it would be nice to throttle the output down from time to time.

And I have come accross mods for this, but I wonder if turning dow the carrier does not do the same. At least my watt meter seems to indicate that I can go all the way from next to nothing to full power by turning the carrier pot.

Do I overlook something??

73 Uwe

Nope, carrier control works fine for CW QRP.

To do SSB QRP, you will need to inject a negative
voltage from a 9 volt battery and 5K or 10K pot into
the "ALC" input in the back of the rig to "fool" it
into running lower power. Or you can play with the
tube screen voltage, using the SG switch on the back;
that is slightly more hazardous and doesn't guarantee
<5 watts on all bands.

1611. Drive, CAR controls on TS 520

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-05-11 13:14:37 UTC
From: othello159
Topic: 1611 Message: 1611

The tune up procedure in my user manual for the TS520 is fine for tuning up the radio but it does not aid much in understanding what is happening.

For rexample the purpose of the drive control???

And especially the remark that when you adjust the drive control for maximum deflection and don't get any, adjust the CAR control until you get a deflection.

Leaves me baffled.

Whatever the drive control is good for, if during use you change the CAR control, for example to reduce or increase power, you also changed the Drive control.

And indeed sometimes I check my adjustements during operation and the ALC meter is jammed against the right end because during operation I touched the car control.

It would be nice if someone could shed some light on the interconnection and the meaning of these controls.

Cheers

Uwe

1612. Re: [TS-520_820_530_830] Drive, CAR controls on TS 520

DRIVE is actually the driver plate, and RF AMP and
MIXER tuning. It needs to be centered for max output
at whatever CAR level you are running, and left there.

CAR raises and lowers the CW output of the rig, only.
It does not affect SSB output.

If CAR is set too high, rotating DRIVE will make
little difference in output until you get far off
resonance with DRIVE; then things drop off. This is
because of the ALC action that levels the output.

If you go to the groups FILES section there should be
a tune up guide there.

Yes, I have seen the tune up guide, it seems pretty much the same stuff as whats written in my users manual.

In there it does not say to turn Drive to the center and leave it alone, so now I am torn, do I believe your version or Kenwoods version.

The tune up instruction do not promote understanding, they promote a tuned up radio.

Now I am more baffled than ever since you introduced a second way besides what was recommended in the Kenwoood user manual by saying that the Drive control needs to be centered and left there.

Confused in Maine

I don't see where Bill said anything about turning the drive to center and leaving it there, Uwe.

Re-read what he said. The drive control is three dimensional, peaking the driver plate, rf amp and and mixer tuning at whatever carrier level you're running, then leave the control [drive] there.

All the hybrid rigs tune up procedure is about or exactly the same.

Van,

not centered physically, as in 12 o'clock... i meant
centered electrically, at resonance.

Ok, Bills second message clears it up I think, when he says centered he means resonance and I assume that that is indicated at a maximum meter deflection.
So we got that misunderstanding out of the way.

I just checked my rig and indeed, if I change the power level (CAR control) I have to adjust the drive control afterwards for max. meter deflection.

The usable CAR range is surprisingly small, at a CAR setting of less than two out of ten the meter is already maxed out, any increase in CAR level and the Drive control gets the meter to go off scale.

At that setting my radio puts out a surprising amount of power, the meter indicates around 800 volts at a bit over 240 mA, my wattmeter indicates a bit over 200 watt but that probably means it needs to be calibrated.
Do these settings sound reasonable?

If you think I sound suspicious of this rig you are right, I am to some degree since the meter in its S-meter capacitiy goes off the scale very easily even after going through the calibration procedures indicated in my manual and in comparison to an Icom R75 communication receiver-something feels out of whack.

Are you sure your SWR is low? A high SWR will make your wattmeter read
high, and could make the ALC meter read out-of-whack (I think.)

1619. Plate current

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-05-12 22:46:44 UTC
From: Grant McDuling
Topic: 1619 Message: 1619

G'day fellas.

I have been following the Uwe's thread with interest and this raises another question in my mind. After I tune my 520 se, I understand my meter should read 240mA plate current, but the best I can wring out of mine is around 180mA. Does this mean I simply need to retune or tune better, or is there something more sinister lurking behing the reading like tubes that are nearing the end.

Regards

Grant

Accepting donations of broken or unwanted equipment. I like to tinker with ham radios. Also if you need a manual for a radio ask and if i have it i will upload it to "Rube" if it isn't already there.
Take care

From: Bill K0ZL
Topic: 1619 Message: 1621

Grant, increase your loading control until you see
about a ten percent "dip" in plate current as you tune
through resonance. If you are not seeing 240mA or
more, yet have sufficient ALC to indicate grid
overdrive is occurring, you either have a weak set of
final tubes or the plate voltage has fallen off due to
bad plate filter caps. Check your plate voltage if
you have that on the front meter; should be minimum
800 vdc at max output.

You may also have low line voltage.

How much power are you getting into a dummy load at
max output, using a known-good external meter?

1623. Frequency Counter in 820s

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-05-13 13:00:36 UTC
From: k2wh_bill
Topic: 1623 Message: 1623

Anyone providing repairs to the frequency counter module in the 820s?

K2WH

1624. 820s Repairs

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-05-13 13:22:10 UTC
From: k2wh_bill
Topic: 1624 Message: 1624

As I understand it, one of the most common problems with old 820s's is the digital readout not working. I have read many fixes on this and one of them says to remove the counter unit and clean all the ground connection points on the PC board and clean all the pins and plug connectors. Did this on a recent acquistion with the same result, no display. The rig does receive nicely and puts out about 120 watts.

Since the cleaning did not help, I have enough 820's to have spare parts. I swapped the counter unit with another unit and the display came on. Great stuff! However, the "7" on 40 meter was a "9" and on 20 meters, the "4" was a "9" etc. with the other bands. Shortly thereafter, the oddball digits suddenly went correct without any further action by me so I let it sit for a while in receive.

Shortly thereafter, the display went dark again and no amount of connector pushing/pulling/shaking was able to get the display back on. Are their any other related items, parts etc. that I should look at to solve this obviously intermittent problem? I have (4) 820's all with varying amounts of display problems.

1628. TS-830 IF-SHIFT noise ??

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-05-14 18:13:27 UTC
From: chuck allen
Topic: 1628 Message: 1628

Hello,

I appreciate the group's efforts to provide information and advice.
I recently acquired a TS-830 and am still learning about it.

I have noticed the IF SHIFT knob, when turned counter-clock-wise
from center position, creates some noise resembling a swirling wind.
It actually gets loud enough to make the morse code difficult to
receive and appears to be on all bands. When the IF SHIFT is turned
clock-wise, the noise level actually decreases from that in the
center position. Is this normal?

thanks
chuck allen af4xk

1629. Re: [TS-520_820_530_830] TS-830 IF-SHIFT noise ??

Yahoo group: TS-520_820_530_830 (2001 — 2004)

From: Bill K0ZL
Topic: 1628 Message: 1629

Funny, that's exactly what DSP sounds like, and we pay
extra for that.

The IF shift will only work well when dual filters are
installed. I think these were options in the 830, to
have the second filters in (ssb and CW narrow), no?

1630. Re: Drive, CAR controls on TS 520

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-05-15 13:17:25 UTC
From: othello159
Topic: 1611 Message: 1630

Some of the questions regarding the tune up of my TS520SE come from confusion caused by the instructions in the manual.

For example, one of the steps is to dip the plate using the plate control.
The next step is to do the final adjustment using the Plate and the Load control and of course I am thinking that now I am changing the setting of the plate control I did in the last step, so what is the reasoning of that 'dip the plate' step??

Also, if you do want to use the rig for QRP you adjust the CAR control so low, that you do not get any deflection in the step where you adjust the Drive control for maximum deflection. The manual suggests in that situation to increase the CAR level, but that is not QRP anymore.
So how do you adjust Drive in that situation??

The idea is to get the plate circuit in resonance
before going for max output; this ensures less chance
of damaging the tubes with excessive off-resonance
current when tuning up.

The plate tuning at max output will be slightly
different than the first step when dipping the plate
current; this is ok.

To run QRP CW, simply tune for max smoke as for
sideband, then just reduce the carrier control for the
desired output. You will need an external wattmeter of
known accuracy to know your QRP output for sure.

hi,

In the file section on yahoo is an external circuit
to let you use the 520/820/530/830 in qrp.
It is just a 9 v battery and a small pot. That sends
-6v to the alc circuit via the aux socket on the back of the radio.

In cw you can use carrier but for ssb the above will produce
a clean signal unlike turning down the mic gain when in ssb mode to go qrp.

For tuneup, just remember Drive-Plate-Load
left to right on the front panel.

From: georgesimmans
Topic: 1633 Message: 1633

I might as some stage wish to take the 520 s mobile with a dc connection to the car battery.

The manual makes mention of a dc to dc converter.. I have never seen such a beast.

Is this neccessary to go mobile

if yes then is it possible to make one?

thanks in advance

george

Hi George.. the rigs that come with the largish TO-3 looking transistors on the back apron have the DC-DC converter built in. All that's needed is a cable wired for DC to go in place of the AC power cord.

I ran an FT-101EE in my Caddy Hearse for a couple of years that way. 100 amp alternator and a large ground plane really helped.

Thanks Bill, this makes sense to me, so the 'dip the plate' adjustement is a pre-adjustment at reduced power which gets you in the ballpark before you give it full smoke.

Understanding the world one bit at a time...

1641. TS-830S signal every 10khz???

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-05-18 19:16:47 UTC
From: Ron Maret
Topic: 1641 Message: 1641

I just received a used TS-830S this afternoon. No antenna up yet but I put a 25 foot piece of wire out the window and connected it to my tuner. I hear a few QSO's on 20M but I also hear a signal about every 10khz. I think I have something turned on that should be off. Any help on this is appreciate. I have been inactive for the past 10 but always maintained some interest. Pulled my 4BTV and TH3JR beam out of the garage and man these need some serious work :-)
Thanks for your help - Ron/WB8WSS

Ron;
Check down by your mic gain control and see if the calibrate marker is on...
..I think that will solve your problem.

You are hearing harmonic radiation from switching
power supply, poss from computer monitor, router,
cable modem, vcr, tv or whatnot. It will get better
when you get antenna up away from the building.

Ron,

When you get back on, you'll wonder why you waited so long. I've been without HF for the past 4 years (except for Field Day and other club activities) at my new house because the basement never got finished and I never put up a tower. Now we are getting ready to move, and I hope I do better in the next house. BTW, it'll be in W4 land!

73,

Eric

1647. TS-830S using Donner's Digital Interface

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-05-20 12:09:52 UTC
From: Ron Maret
Topic: 1647 Message: 1647

I have a new (used) TS830 and have connected an interface for receiving CW, Ritty etc. One of the lines goes to the external speaker out on the back of the rig. When I make this connection it sends sound to the sound card but kills my audio of listening (monitoring). If you have a similar setup, how do you get around this? Thanks - Ron WB8WSS

1648. TS-830S with digital interface, ext speaker connection?

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-05-21 01:27:48 UTC
From: Ron Maret
Topic: 1648 Message: 1648

I am running a Donner's digital interface with my TS830 and using the external speaker output on the rear of the rig which mutes the internal speaker. Is there another output I can use for the the audio out that is not affected by the volumn control and not mute the speaker? Thanks - Ron WB8WSS

1649. Re: [TS-520_820_530_830] TS-830S with digital interface, ext speaker connection?

Phone patch out... if it's high enough level.

Check with AC voltmeter, see if vol. control affects
it

Hello,

I just joined the group and thought I'd drop a line to introduce myself.

My name is Ray, call is AC9H. I'm 42 years old and was introduced to amateur radio by a coworker. I took the tests last August and received my General ticket. Went back a month later and passed Extra. Got a lot of help from another friend and coworker and purchased his TS-530S.

Here is a list of my current station equipment:

Kenwood TS-530S with matching External VFO, External Speaker and Antenna Tuner. These are connected to a wire dipole that runs north-south 30' across the top of my roof then west to a couple of trees in the back yard. My lot is small in a residential neighborhood so I was limited on how I could run the wire. I use a Donner interface to run the digital modes with a IBM 760XL laptop.

I also have an Icom IC-V8000 in my Jeep, a Yaesu VX-5R for handheld fun and a Yaesu FT-8900R that I purchased at the Dayton Hamvention this month.

I plan to use the FT-8900 as a FM base for 10M, 6M, 2M and 70cm. Will use it in the Jeep on trips and when camping. (Until I can afford an ICOM 706MKIIG!)

Looking forward to participating.

Ray

Hey Ron,
When you plug in an external speaker the jack is wired to disconnect the internal speaker, so unless you want to modify the jack you won't be able to monitor using the internal speaker. I use the phone patch in and out on my rig to feed audio to my soundcard. This setup works great. You should be able to get/make a adapter to go from the 1/8 plug to the phone patch out of your rig. Another solution would be to use a T adaptor at the soundcard speaker out to feed a set of computer speakers or headset, this way you can monitor both receive and transmit audio at the soundcard. Also, I believe you can monitor with a headset as you are using the rig now. I hope I have helped!

Thanks, Bill. I'm still waiting for the guys from Dayton to call me and tell me that I won one. heh The 706 is a lot closer to my price range right now. I've spent so much on gear since August that I'm going broke! heh It is a nice rig though.

706 is good rig but I won't work on 'em. Good thing
that they don't break often.

FT-1000D should be flooding the used markets when the
new rigs come out. They are a great radio and NEVER
break.

With reference to the ts-530/-830 etc.Looking for supply of drive
cogs .These are fitted onto the "drive control" shaft ,that via a
chain adjust three seperate capacitors.
They tend to split where the grub screw enters them.
Does any one know the part number,or has anyone got any to sell etc..
Regards

1657. TS-830S SSB operation

Date: 2004-05-23 14:38:44 UTC
From: Ron Maret
Topic: 1657 Message: 1657

I finally got an antenna up and I am read to make my first contact. I tunned the rig and everything looks fine. After the final step of tuning I show IP approx 230ma. I am using a Kenwood MC50 mike. When I go on the air I see no movement of the ALC when calling CQ. Any comments or suggestions are greatly appreciated. Thanks - Ron/WB8WSS

Ron,

ALC indication is NOT necessary for you to have good RF output. ALC only kicks in when you have more mic gain than necessary, and the rig is adjusting the level to keep the power output under control. Ideally, your mic gain should be set so that you only see small, short duration ALC "blips", if any at all. This means you've got just the right amount of mic drive to achieve full output.

The right way to see if you are producing adequate RF is to monitor the output power, preferrably with a good peak-reading wattmeter (or better yet, a monitor scope). If you are getting close to 100Wpep, then don't worry about the fact that you don't have any ALC indication. By the way, the RF setting on the 830's meter will show average power only - so you'll probably only see ~25W indicated on SSB when running full power.

73,
Alan W2AEW

Getting back into Ham Radio is a small bite at a time. I discovered my base for the MC-50 has a bad connection. When I use the mike by itself no problem on getting some ALC or making a contact. Thanks - Ron/WB8WSS

1662. Kenwood TS-520 SE power transformer

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-05-23 14:29:14 UTC
From: Stuart Hamm
Topic: 1662 Message: 1662

Greetings,

I just purchased a Kenwood TS 520SE. The transformer looks like it took a spike on the primary side. I did find a replacement from Kenwood at $116.

Does anyone know where I can pick up a used and working transformer within this group?

Thanks,

Dennis / KB8YGC

230 is a little low.. you should be seeing 280 plus.

Suspect low drive due to bad driver tube or poor
alignment.

I wonder if it would be more feasible to use the mobile power connection
with an external 12V power supply. The external power supply could be used
until you find something at a hamfest or such, then could be used with
other equipment that you may pick up in the future

As I understand it, the SE model is strictly an AC current, 120v, device. When Kenwood created the SE they removed everything that made the 520 and 520S operable on DC voltage. The 520S schematics will show the DC power supply layout but I don't know if there will be room in the case for the conversion. Good luck. Let us know how it goes, I also own a 520 SE.

I did not know there was a difference. I have the earlier 520 version and
I know that there is a wiring diagram in the manual for 13.8 Volt mobile
operation. He would have to look in the manuals and see if that is the case
with the SE version.

I believe the PTT on the mic connector is 12V, and less than 2mA when
when pulled to ground.

Hi group,
You may or not remember but I`ve posted before about my ts-520 that I`ve had never got to set up (yet). Owned it since 88. I fell out of the hobby. Well for the last year or so I`ve been trying to get back in to it. I just got a new qth and I just set it up. I just got done playing around with it (just monitoring) and I noticed the vfo knob feels kinda "rusty". It`s not has smooth has it used to be. I can definitely feel the difference compared to my vfo-520. I always kept my ts in storage under the best possible conditions.
Well anyway`s is this something I should really be concerned about? I can`t help to think "yes". Keep in mind that I don`t have the skills or the know how to dig into my radio. Any suggestions of what I should do? Sorry, I`m just a little inexperienced and no elmers in my neck of the woods.
Thanks. Kyle n0mkh

The SignaLink Has an external power plug if the rig connector (mike or ACC)
does not provide the required (if I remember 12 - 15 V) voltage.

1674. Re: [TS-520_820_530_830] TS830S SignaLink Interface

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-05-25 03:30:38 UTC
From: Alan Wolke
Topic: 1667 Message: 1674

I just measured the PTT on my 830S - The open circuit voltage on the PTT
line is 12V. When shorted to ground, PTT current is 1.8mA.

73,
Alan W2AEW

Get some metric allen wrenches ($8.00-$10.00 any auto
parts store, good investment) and remove the knob. Put
a drop of good old 10W-30 motor oil on the VFO shaft,
it will feel good as new.

Hmmm,

Seems as if the transformer is now discontinued at Kenwood parts. I guess the next option is to find another 520 that is being parted out. I will keep looking on ebay and hamfests eventually I will run across one. I was hoping to find one soon.

Thanks for the help.

So far I have tried PSK31 Deluxe, DigiPan, Ham Scope, Ham Radio Deluxe, WinWarbler, MixW2, and MRP4060. I seem to get the best results from MRP4060. I could not get most programs to work, maybe my fault not the software. However MRP4060 is easy to use and works extremely well with about 95% positive results. Anyone have a favorite piece of software for this? So much stuff and so little time :-) Your comments or suggestions are welcome. Thanks - Ron/WB8WSS

While I have been endeavoring to use my brain as a CW-decoder, I have also used MultiPSK. I've never used it to operate PSK -- don't know how, don't currently have any strong drive to learn -- but I have used it to decode other digital modes like CW. I had hoped to use it for the Armed Forces Day event, but that fell through. I don't recall whether or not W1AW transmits on Memorial Day -- if so, I'll test it against their other digital modes.

Jack.

Ron,

I wrote an article for QST about a year ago on this very topic. Due to a production error, they published it on the ARRL website by mistake so you can read the whole thing here:

http://www.arrl.org/news/features/2003/06/18/1/

The summary is that computers can copy very clean CW, but most operators are not consistent enought to allow the algorithms to copy accurately. The decoders must first detect the speed, then they go about the business of decoding the intelligence. If the operator has any fluctuation in speed, interword gaps, etc. the decoder will stop for a few seconds while it recalibrates the speed. Depending on how inconsistent the fist is, the decoder spends most of its life recalibrating and no time decoding.

As a result, my conclusion after some pretty complete testing was that the best way to decode CW was a well trained pair of ears. My personal "ear decoder" only works up to about 12 WPM, but I am still working on it. If you want to use a program to help, the best results were obtained with CWGet and SkySweeper, two commerical products from Europe. CWGet is $35 and SkySweeper, which works with many different modes (RTTY, PSK, etc.) runs $120 to $630 depends on the configuration you order.

73,
Jim / K1ZC

Hi Jack,

The mil stns don't use CW on Armed Forces Day any
more, as far as I know.

Best way to test is to snag one of the guys on the
group for a sked. My digital stuff is not hooked up
yet or I'd do it.

The ARRL bulls come out in RTTY (Baudot), Amtor mode B
(FEC, sort of a high-tech RTTY) and ASCII (antiquated,
but nice to see lower case now and then! hi). I don't
know if they do PSK31 bulls yet.

Nah, they do AMTOR and PACTOR and stuff. That's why I downloaded
MultiPSK, because it could do all of that and more. It's just a minor
side benefit to have it decode CW.

Bill> Best way to test is to snag one of the guys on the group for a

1688. CW/RTTY Setup for 520

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-05-27 04:52:26 UTC
From: jason@creager.com
Topic: 1688 Message: 1688

I just bought a TS-520. It hasn't arrived yet, but I'm anxious to get on HF. So far, it looks like it will be a CWGet and CWType setup for RTTY. My key is an MFJ 422D, so I'm thinking CWType will be setup using the parallel port. Of course, I want to run RTTY, too, but I haven't looked into that yet.

Is anyone using the interfaces supplied in the CWGet/Type docs or are most people running a RigBlaster type setup?

Also, do you think a HP Brio Celeron 333Mhz. Tower/ 64MB/ 3.2GB/ CD would be stout enough to run the above software and a logging program? It's a $40 computer, so it's mighty tempting. Of course, for $110 I can get a Micron PIII 667Mhz/ 128MB/ 10GB/ CD. (prices from surpluscomputers.com)

Since this will eventually be a backup rig to an IC-718 or 706MkII, should I just spend the extra money for the PIII system?

Thanks for the input,
Jason

1689. TS-520S power output

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-05-26 03:16:12 UTC
From: rcarp5
Topic: 1689 Message: 1689

I just received a nice TS-520S in trade and I'm really enjoying the radio. It has a great receiver and I have gotten good on the air reports. I have one question concerning the rf output of the TS-520S that maybe someone can help me with. It seems to load up fine on all bands with about 200 ma plate current dipped and 125 watts carrier into a dummy load. When watching the output on my watt meter (built into my MFJ949 C antenna tuner) I only see about 30-40 watts on voice peaks. When watching the plate current meter on the radio it indicates about 100-125 ma on voice peaks. Maybe this is normal, when I compare it with my TS-440S I get about 100 watts carrier and over 50 watts on the watt meter on voice peaks. This is with the processor on both radios on and keeping within the ALC range. On the air comparisons show that the TS-440S has a stronger signal. Do I need new final amplifier tubes or? Thanks, Larry Carpenter, AA4VI

hi Jason,

P III has faster bus speed over celeron.
Should be no problem for either pc to run the software.

The system with more memory will save you money
over adding more memory to the less expensive pc.

Shipping should be about the same.

Is the operating system included or do you have one ?

If your power meter is not a true "peak reading" type
(NOT the MFJ interpretation of "peak reading"), you
should only see 10-25 watts on voice. This is normal.

Check the rig full bore into dummy load on CW... This
will be your PEP output on SSB plus a little.

1692. NO 10 meters in TS 830

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-05-27 18:22:01 UTC
From: ka9vaa
Topic: 1692 Message: 1692

My 830 receives on 10 meters but Has no output, I can not load at all, I have cleaned the band switch. It loads and works fine on all other bands, anyone have any suggestion on where to look for a problem?

Thank you

tom

1693. Re: CW/RTTY Setup for 520

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-05-27 22:33:06 UTC
From: Jim
Topic: 1688 Message: 1693

See my reply in message 1680 regarding computer programs. When I did the original work cited in the article, I used a very tired old Compaq laptop running Win98 and a clock speed similar to your HP Brio and CWGet worked fine. Actually, the bus speed has more to do with it than the chip - the programs are not that processor intensive. A Pentium III is overkill.

I do digital by connecting the sound card to the phone patch with some $2 cables from Rat Shack. This is not 100% safe, since the voltage from the rig is not isolated from the computer. RigBlaster and similar boxes have an optical coupler to electrically isolate the rig from the computer. It probably won't hurt the rig, but if you get transient voltage down the cable it might fry your sound card so you are forewarned. On the other hand, at $40 it might be worth the risk.

If you are looking to go inexpensive, I suggest you try Hamscope with the MMRTTY engine. Both are freebies, and Hamscope is great for both PSK and RTTY. CWGet is the best decoder under $100, but none of the CW decoders work that well (read the message referenced above). As far as I know, CWType and all encoders work via the sound card but I could be mistaken. If you need the links to get the software, feel free to e-mail me or check out the article linked from the above referenced message - I think the links are in there.

73,
Jim

1694. Solution to TS-520s no IP current in Tune?

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-05-27 22:40:32 UTC
From: Anthony L. Mach
Topic: 1694 Message: 1694

Hi All,

My name is Tony (callsign AB9IO), I'm glad to be with you all!

My rig is a Kenwood TS-520s. I just set it up last night and made a QSO, so I know it's working. I don't have any current dip in Tune mode though. I've read the posts on this, but I didn't get anyone that posted what their solution was. Can anyone give me a hint on what's going on with my rig?

1695. TS-830S grounding

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-05-28 10:48:48 UTC
From: Ron Maret
Topic: 1695 Message: 1695

When I'am connecting the coax line to my tuner which is connected to my TS830 I feel a tingle when holding the outside of the PL259 and touch ing the TS830. Makes me think there is current/voltage flowing throught the cabinet of the TS830? How can I prevent this? Ron/WB8WSS

1696. Re: [TS-520_820_530_830] TS-830S grounding

Yahoo group: TS-520_820_530_830 (2001 — 2004)

From: NORM FUSARO
Topic: 1695 Message: 1696

Ron,
It sounds like you need a good earth ground on that rig. The best is as short as possible heavy lead to a 8 ft ground rod pounded into the ground. All ground connection should be clamped not soldered. A convenient way to ground station equipment is to use a common ground block; all gear is grounded to the block then the block is lead to the ground rod. Do not daisy chain or ground equipment from one to another to a ground. If there is a fault in one piece it will send current through all pieces on it's way to ground and could potentially damage components along the way. Especially true when using vintage tube gear and high voltages. Each piece of gear must have it's own ground to the common point ground block. I use a commercial block found in the electrical dept of Home Depot. It looks like the block in your electrical panel. Some guys use a piece of copper and run bolts through it, or a piece of pipe and clamps.
Good grounding is not only a safety measure but it will help eliminate about 90% of potential RFI problems such as RF in the shack and noisy receiver.
There is some really good info about grounding on ARRL page:
http://www.arrl.org/tis/info/grounding.html

Hope this helps.
73,
Norm, W3IZ

Sounds like you probably have a leaky filter cap in that radio. Many old
rigs develop this condition, and are quite usable for a long time, but you
have to ground it!! You really need a good electrical ground to that rig,
pronto!

CWType includes schematics to build a serial or parallel interface directly
to the rig's key input. The parallel version can be used with an iambic
paddle. It's probably how I'll do it.

Thanks for the advice.

Subject: [TS-520_820_530_830] CW/RTTY Setup for 520

I just bought a TS-520. It hasn't arrived yet, but I'm
anxious to get on HF. So far, it looks like it will be
a CWGet and CWType setup for RTTY. My key is an MFJ
422D, so I'm thinking CWType will be setup using the
parallel port. Of course, I want to run RTTY, too, but
I haven't looked into that yet.

Is anyone using the interfaces supplied in the
CWGet/Type docs or are most people running a RigBlaster
type setup?

Also, do you think a HP Brio Celeron 333Mhz. Tower/
64MB/ 3.2GB/ CD would be stout enough to run the above
software and a logging program? It's a $40 computer, so
it's mighty tempting. Of course, for $110 I can get a
Micron PIII 667Mhz/ 128MB/ 10GB/ CD. (prices from
surpluscomputers.com)

Since this will eventually be a backup rig to an IC-718
or 706MkII, should I just spend the extra money for the
PIII system?

Thanks for the input,
Jason

Hi Tom I have a 530s, same problem cause mine was put out when the use of the WARC bands were still being debated so they have a diode blocking their use. All you have to do is remove the diode.
Not sure if this is the same with your rig ?
You would need a schematic to help you though, I have not done this mod yet.

Most problems for the 820 revolve around the
PLL/VCO/Counter unit having bad connections between
boards; or someone trying to locate a display tube.
Other than that, the 4 rigs of concern to the group
all share the same issues to some degree.

1710. Re: [TS-520_820_530_830] TS-830S grounding

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-05-30 13:17:08 UTC
From: Bill K0ZL
Topic: 1695 Message: 1710

Change to a 3-wire AC safety cord, vs the two-wire in use now.

There are two-0.01uF caps from each side of the AC line to the chassis, leaving the chassis at 65 volts AC to ground. Very low current but you can feel it.

You can also hook earth ground to the chassis of the radio before plugging it in. I prefer a 3 wire cord because then it is automatic.

73,

Bill

1713. TS-820s Brand New, In the Box, Never Used

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-05-30 20:03:36 UTC
From: k2wh_bill
Topic: 1713 Message: 1713

Some of you may know from a previous posting, that I found and purchased a Brand New TS-820s rig. All documentation, box, warranty card, the works. Even the original box is just off the shelf. (See Photos section).

It works fine but now I am in a delimma. Since the rig is brand new, never used, in the box etc. Do I dare use it or do I keep it "Brand New In the Box, Never Used"?

You guys may think this is stupid, but the reason I got it was because it is/was Brand New in The Box. Since I put it on the air to test it for about 1 hour I guess technically it is USED. But is it still brand new? This is driving me crazy. I don't want to use it because it is so perfect.

Decisions.....

Mike,

I think I'll pass on that one. I currently have (2) other 820's on the bench for testing and
refurbishment. I am currently using a 3rd 820 in the shack. I guess the New one which
is in the box is my 4th 820. Go to QRZ.COM, type in K2WH and you will see a picture
of the Kenwood station currently in use.

You took it out of the box and used it. It's been used. My TS830S and it's original box still look perfect too after 25 years. Remember, just because it's "new in the box" for 25 plus years, the components in the unit have still aged for 25 years. It's all in the mind.

Do we buy them for collector value, or to use them?

In the box it will just get all froze up and unhappy,
being driven to the depths of radio depression from
non-use.

On the shelf, gently used, both of you will enjoy it
more I think.

Try this from kenwoodparts.com:

K29-0370-00 (L5) KNOB (BLK) FOR PADDLE SW TS-520 TS-820
S-520S TS-820S

If the paddle is already loose or broken it is easy to remove, simply move
it to the mid position (so it is pointing straight out) and pull it forward.

Are you able to get any plate current at all above the
60mA idle current?

From: Anthony L. Mach
Topic: 1694 Message: 1727

Hi Bill,

Thanks for the reply. I'm getting a current dip in all other modes
besides tune. In Tune, I'm getting almost no current showing on the
meter to dip. Strange?

You should see about 10 percent dip in plate current
in either tune or CW modes... Any less indicates
excessive "loading" of the plate tank circuit to the
antenna or dummy load. This is controlled with the
loading capacitor adjustment; CCW is MORE capacity or
LESS loading or MORE plate current dip; CW is the
opposite.

Agreed.

My concern is that with no ALC indication, one or more
gain stages are faltering, if the rig is unable to
drive the grids into conduction.

This would indicate component failure or need for
alignment, which may or may not contribute to other
problems.

From: Eric Webner
Topic: 1694 Message: 1732

Hi Anthony,

I have owned and modified a TS-520 since 1980. One of the mods I did (years ago) involved modifying the fixed channel selector switch (you could put in optional crystals for a favorite frequency) so that it switched between the CW and SSB if filters while in CW mode. This was particularly good if you had a really tight CW filter (mine is 250 Hz wide).

The point of all this is that either the very tight filter or the selector switch mode somehow made it so that I could not use TUNE mode. I can accept that, and I simply tune into a dummy load, then tune briefly on an clear frequency, using CW mode.

Do some digging, and see if such a mod was performed on your rig. Good luck.

I used to have to simply flip the non-polarized plug around to get rid of the tingling sensation. Its easier, but definitely take Bill's advice and put a real cord (3-prong) on it.

73,

Eric KA8FAN

Bill K0ZL <coorsbill@...> wrote:
Change to a 3-wire AC safety cord, vs the two-wire in use now.

There are two-0.01uF caps from each side of the AC line to the chassis, leaving the chassis at 65 volts AC to ground. Very low current but you can feel it.

You can also hook earth ground to the chassis of the radio before plugging it in. I prefer a 3 wire cord because then it is automatic.

73,

Bill

Sounds like the TS-440S has higher compression, resulting in greater average power. The TS-520S processor compression is fixed at about 10 dB, and I think the 440S is adjustable (not sure).

73,

Eric KA8FAN

rcarp5 <rcarp5@...> wrote:
I just received a nice TS-520S in trade and I'm really enjoying the radio. It has a great receiver and I have gotten good on the air reports. I have one question concerning the rf output of the TS-520S that maybe someone can help me with. It seems to load up fine on all bands with about 200 ma plate current dipped and 125 watts carrier into a dummy load. When watching the output on my watt meter (built into my MFJ949 C antenna tuner) I only see about 30-40 watts on voice peaks. When watching the plate current meter on the radio it indicates about 100-125 ma on voice peaks. Maybe this is normal, when I compare it with my TS-440S I get about 100 watts carrier and over 50 watts on the watt meter on voice peaks. This is with the processor on both radios on and keeping within the ALC range. On the air comparisons show that the TS-440S has a stronger signal. Do I need new final amplifier tubes or? Thanks, Larry Carpenter, AA4VI

Hi Eric,
thanks for that info, i have reset mine at 60ma on cw and it is now about
just over 50ma
on cw, i seem to remember there was a post on here saying you could set the
bias to 50ma.
Still get outputs just the same no problems noticed.....

1740. Re: [TS-520_820_530_830] TS-830S grounding

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-06-03 03:24:26 UTC
From: f x
Topic: 1695 Message: 1740

The line cord mod is pretty simple. I did mine just last evening, by coincidence. On the side of the transformer away from the back wall is an earthing pin... connect the green wire (ground) to that. White to the terminal strip, and black to the fuse holder. I also put in .01 caps @1kv, with parallel MOVs to help with surges... The whole thing from start to finish was less than an hour. Getting the old wire remains out was the hardest part. Next hardest was securing the power cord, as the grommet provided no longer is usable. I did it with tie wraps.. Then I put a ferrite block right at the back of the chassis.. No RF on the power line now. And the rig works just fine.

PS... watch the soldering iron on all the other little wires back there... they are PVC as opposed to the more modern teflon, and will burn easily...

1745. TS-830S Alignment - VFO Question

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-06-03 12:07:19 UTC
From: bill_graham0
Topic: 1745 Message: 1745

Help!

Performing a TS-830S alignment using the service manual. Step ("Item") #9 ("VCO adjustment and check"). Freq counter connected to TP4, DVM to PLL-TP1. Adjustments are T1-T6 on the PLL (band dependent).

Service manual instructions for this step:
"Check the frequencies at the following points and adjust coils until those given in brackets are obtained".

Two Issues:
1) with the VFO set to the designated points, the measured frequencies are all off +/- 1500 Hz, depending on the setting of the USB/LSB mode select switch (note: the service manual doesn't mention the USB/LSB mode switch setting). Is this correct? An I doing something wrong? Are the frequencies listed in this step supposed to be exact, or just approximate?
2) adjusting the designated coils changes the (DC) voltage measured on PLL-TP1, but has no not affect the measured frequency. Is this normal?

Basically, I cannot adjust the frequencies to the values specified, but I'm not sure the freq values are really the exact targets, or simply approximates.

Is the purpose of this step to really set the DC levels, and the given frequencies are simply approximate, or should I be troubleshooting why the frequencies are off (by +/- 1500 Hz)?

Given how easy it really is, I would not worry about replacing with a two wire cord. Only issue is to make sure you deal with the strain relief issue... you will need a binder grommet to hold the new conductor... probably round.. in place.. May have to make the hole slightly larger if you use large conductor wire... otherwise no sweat...

1749. TS-520 modifications to transmit and receive AM.

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-06-06 00:15:11 UTC
From: gi3vaf robert
Topic: 1749 Message: 1749

Hi,

I have seen an article 'AM at a pinch from a TS-520'. However, I want to convert my TS-520 to transmit and receive AM properly.
A 6KHz filter was mentioned as an option for AM. These are around but quite expensive.

I can visualise some out there screaming "why on earth would he want to covert it for AM". Well, I am old enough to remember when there was little or no SSB, and it was a joy to listen to 'real voices'.

The rig has to modified to insert a carrier on transmit and remove hetrodyne insertion on receive, with a 6KHz filter. Somewhere out there details of this modification exist, but I can't find them.

Regards

Robert

Yes I have looked at that article on www.mods.dk.
The method described doesn't use the 6 MHz filter, so reception is
as SSB.

1754. help please Trio PF-810

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-06-06 22:53:51 UTC
From: bill
Topic: 1749 Message: 1754

Hello All,
I know this is not TS530 ETC BUT CAN ANYONE HELP PLEASE?
i have just picked up an imaculate Trio SWR/POWER meter, it is a PF-810
Has anyone in the group got any info on this by any chance, done a search of the net but all
i could find was a picture of it. I would like to try and get hold of a manual for it, or a decscription
of its functuion switch. I know what swr, power, cal, ref is but what is RAD ?

Mnay thanks

I am in the process of repairing (3) Kenwood 820s's. One is done. The one standing on end. Found the intermittent problem with the display.

Rock solid, cleaned up and lubricated. Found wonderful contact cleaner and metal cleaner. I am starting to know these units quite well.

Works well, 100 watts out on all bands. Tomorrow, the other one with a display problem also.

I would be interested to know any of your experiences of replacing the subject mentioned FET from various parts of a Kenwood 599D receiver (assuming it was used in 830,530,520,etc or similar vintage units) with a NTE222 or other ?? Or is there a better alternative part? Kenwood's parts site says it is discontinued with no substitute mentioned.

Thanks in advance,
Greg

Greg you may want to check out the nte data sheets.
They both crossreference to 3sk22.
I managed to purchase some obselete parts at a company
called tiptop electronics. If you need their 800 #
let me know.

Ah, it's a home radiation detector! hehe... just
kidding.

If it has a small threaded bushing on top, that's
probably the field strength function "radiation"...
maybe switches from the reflectometer inside to the
external whip antenna.

Just guessin'.

Has anyone made of list of the most common screw sizes and threads of the screws used on Kenwood equipment? I am changing old rusted ones for new shiny ones and it seems there may be as many as (4) different types or sizes. Sheet metal inside, dress inside and outside. I think they may be metric?

They are metric. The cover screws are M4x8 pan-head,
phillips head machine screws. I think the major hdw
stores will have them; if not, order N35-4008-41 from
Pac. Coast or East Coast Parts.

1768. Digital Display

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-06-07 14:51:57 UTC
From: Bill
Topic: 1768 Message: 1768

Heres one. In my efforts to get multiple Kenwood 802s's going, I have one difficult one
and of course it is the digital display. After cleaning everything in the rig meaning all
multiple pin connectors, solder paths, ground connections (in the counter box) I get a
totally blank display. I have other ts-820s which went through the same regiment and
the displays came back nicely. Not this one though.

Receiver and transmitter work fine. Everything but the display. Looking in the service
manual for voltage levels, at the output connector for the display tube, I find almost all
the pins have -25 volts DC on them. Looking at the schematic, this seems to be correct
at least for the display voltages and segment information. The supply line coming off D16,
a zener diode (don't know real voltage here), is split between RB1 & RB2. Under no load,
these voltage should be correct. I think it is line "DP" that is reading about 5vdc.

My question is this: Does anyone know what the voltages should be on the display tube
connector and, how does one know if the display tube is bad, and how does one go about
and test the display tube?

K2WH

Smaller and lighter; integrated counter instead of
discrete; simpler PLL/VCO loops, simpler IF deck but
loss of no functionality or performance. Same physical
size as a 530.

Did a little research on the screw issue with the Kenwoods. McMaster Carr, has the cover screws, stainless steel for $8.97 per 100 or $.08 per screw. So the guy on Ebay is making good money (if you want to take the time to do it).

East Coast Parts wants $.25 for each screw.

Of course, there probably is a minimum order. I believe McMaster-Carr is $ 25.00. I have an open account with McMaster-Carr and just ordered 200 of the cover screws. If anyone wants any let me know (free).

I think the 830 also has warc bands, as well, but I do like my 820.

If you are aware of the few flaky things, as with every piece of gear out there, you should love it.

I think the two biggest outside of wear and tear would be the T/R relay (that I have a secret source for brand new ones) and the display issue. There was a replacement part for it, but has been discontinued sometime in the last four years.

Hi, I used some de-oxit to clean the pots and band switch in my TS-830 now I have a problem. when I turn on the radio, lets say its set to 14300.0 everything seems to come on but if I use the main tuning dial to say change to 14305.0 it changes but the digital display stays at 14300.0, if I turn off the power and back on it will then go to the new 14305.0. in addition if I change the band to 3.8 the display will stay on 14.300 if I turn power off and on then it will show the 3.8. its like this across the board all bands. did I wash some dirt down into something or what???????

Clean the DH (Data Hold) switch again. It's probably
stuck.

On problem with cleaning switches is sometimes we also
remove the lubricant and the little catch and release
levers quit working right.

Hi there,

Does anyone have a cheap microphone for a 520? My rig arrived today with no mic and no external digital display as I was expecting. (It has the hookups for the digital display, but the ad did not say "digital display ready" or "adaptor".)

Any recommendations if no one on the list has one for sale?

Thanks,
Jason

The MC-60 was the desk mic sold for the 520-530 etc
series, and has selectable hi and low impedance. They
run from 50 to 80 bux on ebay.

The CB mic and transformer will run you a lot less, is
available now but will require some soldering.

I'm in Las Vegas. Currently don't have an antenna up
yet, but will have a G5RV by this weekend and a Hy-Gain
7DXXwhatever on a tower by the end of summer. Looking
forward to actually using this General ticket that I've
had for probably close to two years by making a first
HF contact.

It'd be cool to have a complete Kenwood station, for
sure, but I'm one of those "well, if I'm going to spend
$75, what can I get for a little more?" kind of people.
So, if I could get a great sounding mic (Heil?)for a
little more, then I'll just save my pennies.

THanks,
Jason

Hi Bill,
i have managed to get hold of a manual for the PF-810
and the RAD position is a very nice feature on it. It gives a reading
which shows the Power out minus the refracted (japanese manaul !) power.
It actually says " At the RAD (radiant) position, radiant power, that is
forward power minus refraction power(RAD=FWD-REF), is measured on the
meter.In the absence of
refraction, the reading of FWD is practically equal to that of RAD."
Just thought i'd let you know, if anyone ever needs a manual for one i have
now got it in pdf format.

Ah, it's a home radiation detector! hehe... just
kidding.

If it has a small threaded bushing on top, that's
probably the field strength function "radiation"...
maybe switches from the reflectometer inside to the
external whip antenna.

Just guessin'.

Get the Heil HC-4 or HC-5 element and stick it in a mic of some type, maybe bought from hamfest or whatever. Then get you a lo to hi-z transformer and crank 'er up... probably do the whole thing for under $40.00.

Also if you can find an Astatic mic with the 10DA head (the bullet, not the lollipop D-104), that will give you great SSB audio.

Or find a "dead" D104, and put a Heil element in it. I did that for a local guy and he loves it.

Another thing you can do is to get a studio mike, like a Heil, which is not all that expensive. I have a Heil ICM for my Icom 718. I converted an old architect lamp by pulling the head off of it, mounting an SO-239, which has perfect threading for the stand adaptor, and put in some stronger springs. So by using houshold junk, came up what I think equals a $100 or more fully adjustable boom.

Yes there is a 520s.
It is a very fine rig.
I have one that I like a great deal..I could use a external 520s vfo though ;)

Cleaning up a bunch of "K" rigs and accessories. I have a group of
external VFO's, 820's 520's etc and I noticed I have both a TS-520
vfo and a 520s VFO. They look very different from the outside.

It occured to me, I do not know the difference between the rigs. Was
there a TS-520S? I know there was/is a 520se but what about the 520s.

I think the 520 only did 10m - 80m with no WARC bands if I recall correctly.
The 520s adds 160m.

It also adds the outputs for the Kenwood digital display. Other than that,
I've been told they're pretty much the same.

K2WH/Bill, now that I have my 520, I'd be very interested in a VFO-520,
SP-520, or mic if you want to part with them.

do a google search on TS-520 and you will find a swedish site (it loads slow) with the info on both rigs and accessories.

The schematics are quite different also. The 520 had
hard-wired tube sockets and the 520S a PC board; it's
like two different rigs. They both perform quite
well.

I will stand corrected for improper description. It is a hand held that should either be connected to a boom or a stand. When on a stand it looks like a mike from an old Johnny Carson show or one that belongs in a stand for stand up comics or whatever. Any way, go to the Heil web page and take a look at the ICM mike. They can be had at a hamfest for about 75 bucks and they work well with the switch, foot switch, VOX or whatever. It was the idea of the homemade boom I was trying to get across, and apoligize for the use of studio in my description. The original poster would not want the ICM but I think they make others in the same physical form.

Hi all, have just discovered, by listening to a known local beacon, that my digital display on my 530s reads 2 khz high. I listen to a beacon on 28.200, but to hear it I have to tune to 28.198. I have done the re calabrate thing with the trim pot, but I am still 2 khz out. Does anyone have any clues or should I just live with it and do the adjustment in my head.
I have checked this also with other know beacons, transmissions as well.

Topic: 1808 Message: 1808

Hi all,
Now I need to apologize to the gentleman who referred to the
Heil "studio" mic. My criticism of the term "studio" in relation to
the Heil mic was meant to be critical of the fact that Heil refers to
it that way, not to the group member who used the term--it originates
with Heil itself.
I was just pointing out that, in my experience, they don't show up in
radio stations, not to criticise the group member. No offense
intended!

It's TC1 on the PLL unit, bottom side of rig. About
half way back on the circuit board, near the ref. osc.

Set up on known signal and adjust this for zero beat
with your counter and VFO set to the freq of the known
signal.

It's almost always on ebay in spray cans. You can also take a cabinet top
or something to the paint store and they will mix it for you.

Bob is involved in professional recording; I wonder if
his mics are showing up in recording studios? His
hi-end ham mics are relatively new to the market,
compared to EV and others; it may take a while to
penetrate the broadcast market.

From what I have heard, his mics exceed all but the
very expensive Sennheiser microphones for voice
quality. I would not be surprised to see them in
newsrooms and production studios. Perhaps not in the
control rooms just yet. They certianly are affordable!

Thanks Bill, does this mean I set the display to 28.200 (known beacon) and
then tune for a normal signal? ie 800 hz offset as you would normally
listen to it.
Sorry to sound a bit daft, I'm pretty new to all this.

Subject: [TS-520_820_530_830] heil "studio" mic

Hi all,
Now I need to apologize to the gentleman who referred to the Heil "studio" mic. My criticism of the term "studio" in relation to the Heil mic was meant to be critical of the fact that Heil refers to it that way, not to the group member who used the term--it originates with Heil itself.
I was just pointing out that, in my experience, they don't show up in radio stations, not to criticise the group member. No offense intended!

Dale,
Unless David Letterman has changed mics, he was using that mic long before
Bob Heil was manufacturing an imitation version.

1817. Still Working on the 820's

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-06-14 17:03:54 UTC
From: k2wh_bill
Topic: 1817 Message: 1817

Well I'm still working on the 820's and the 3rd one I opened up revealed something different from the other 2.

Referring to the digital displays, the flourescent tube, the 2 prior units, had wires soldered to both ends of the tube. This 3rd unit, flourescent tube has all the wires soldered to a single PC board located on the back or rear of the tube facing the VFO casing.

Does anyone know the significance of these two different tubes? Which one came first in the manufacture of the 820s's.

K2WH

1818. And now to the 520

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-06-14 17:13:05 UTC
From: k2wh_bill
Topic: 1818 Message: 1818

My next rig to clean up and restore is my 520. All was going well with a fully functional rig, (worked fine) until I decided to service the switches, pots, other controls and calibrate the VFO. Get rid of some scratchy noises.

Anyway, I accidentally shorted the external VFO cable and transistor Q8 on the VOX board blew up (literally). The only thing left are the 3 leads still soldered to the board.

Anyone have a replacement for this transistor?

K2WH

1819. I Should Have Known

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-06-14 17:16:00 UTC
From: k2wh_bill
Topic: 1819 Message: 1819

If its working don't fix it. How true. BTW, my previous post, with this VOX transistor gone, it seems the key line to the transmitter is none functional. Receive is ok, but can't transmit.

I'm pissed.

Tom,

Not sure what your trying to see on the meter by rotating the drive control? Are you trying to see receive signal strength or RF output?

The drive control for transmit is usually very broad. For receive, I have noticed increased signal strength over a broad range also. Let us know the details.

Not recommended, because you really can't hear a
"carrier" on zero beat.

Best way is to tune in a shortwave station of known
frequency on 40 meters; using LSB or USB, adjust that
trimmer for most natural sounding voice or music. You
can also use someone on SSB that knows their rig is
OK.

1829. TS-520 Phone Elmering?

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-06-15 00:58:32 UTC
From: Jason Creager
Topic: 1692 Message: 1829

Hi there,

Would anyone from the list be available to walk me through getting this thing on the air? I tried to follow the manual, but must've missed something because I could only send RF when in tune mode.

Of course, I'll pay for the phonecall.

Thanks,
Jason

The 28 and 24 meg coils will need to be tweaked due to
age or if you ever change driver tubes.

I'm guessing but I think it was called a voice box. The actual components that Joe Walsh used were a funnel some hose and a speaker. But as he put it, it didn't look professional so he had Bob build an electronic version of the hardware store special.

I'm getting good at starting stuff around here

Anyway, the gold line is the same physical shape as the ICM I converted to a boom mike with an old architect lamp. For $75 total cost, I am happy with it. Oh yeah, I spent another $5.00 at rat shack to get a foot switch for it, too! The socket is already there in the ICM, just have to have an adaptor plug.

1837. RE: [TS-520_820_530_830] NO ten meters 0n 830

I once had a similar problem with my 830 with 10 meters. Don't know if it applies here. The band switch is plastic which gets britle over time and the shaft is connected by set screws which can cause the shaft to break. Another phom of the 830 is in the wafer switches themselves. Kenwood used dis-similar metals in the contacts......one was copper and the other tin, which through time can cause some contact problems. You said you cleaned your contacts so this is not likely but one never knows.

Tom,

Not sure what your trying to see on the meter by rotating the drive control? Are you trying to see receive signal strength or RF output?

The drive control for transmit is usually very broad. For receive, I have noticed increased signal strength over a broad range also. Let us know the details.

It's not the bandswitch shaft itself, it's the 1/4"
dia coupling, which is still available.

Dale,
Unless David Letterman has changed mics, he was using that mic long before
Bob Heil was manufacturing an imitation version.

1849. TS-830s

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-06-15 21:10:15 UTC
From: r tg
Topic: 1808 Message: 1849

I got an 830 I am in the process of "de-11metering". The PA section was hacked and I have partially functional. I have several bands with low power out. It is not the drive to the PA but appears to be in the output filter. The bands in question are 7, 14, and 10m. I get about 110watts out on the other bands. The bands in question range from 50 to 70 watts out and the 6146s glow when in the send position for more than just a few seconds. The other bands have no glowing. I suspect the wafer switch.

Any other places to check are greatly appreciated.

Tnx,

Rob

1850. TS-820s Digital Display Problems

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-06-15 23:48:36 UTC
From: k2wh_bill
Topic: 1850 Message: 1850

Of course I have problems you say. The digital display is a well known problem with the 820's. I have repaired 2 of these units with flaky displays by removing the counter and tube, opening the counter and cleaning all the connection pins and checking for solder connections to the thru holes in the boards.

Anyway, on the 3rd unit, after cleaning the display came on nicely. Tuning around on the bands, I got these readings

Analog dial Digital Display

Band 160 80 40 20 15 10

500 2.300 4.000 7.700 14.700 23.700 28.700
400 2.200 3._00 7.400 14.400 23.400 28.400
300 2.300 3.800 7.300 14.300 23.300 28.300
200 2.000 3.700 7.200 14.200 23.200 28.200
100 3._00 3.600 7.300 14.300 23.300 28.300
000 3.800 3.700 7.000 14.000 23.000 28.000

Strange readings indeed. While the display now works (somewhat), can anyone explain the strange numbers?

K2WH

Thanks Bill, I am now within 100hz, can't seem to wring that last little bit out of it, but I reckon thats probably close enough. I found another beacon on 28.164 which is low power and very very narrow and I can get this on 28.163.9, but 100 hz either way and it's gone. Much better than 2k anyway :-)

I'm not sure of the wisdom of cleaning the radio when
power is still applied to it unless of course i read
that wrong. But i've done the fix something till it's
broke thing before so i know how you feel.
Oh and i'm back from two days of camping (It was a
success.... my wife and i are still alive hi hi)

Hi,

Can anyone give me a hint on where I could tap a constants level AF signal from my 830S, one which is independant of the AF gain control setting, i've already tried the accesory connecter, but the level still changes.

I've tried to work it out for myself and failed, all help appreciated.

1855. Glowing Outputs

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-06-16 23:30:48 UTC
From: R. Braddock
Topic: 1855 Message: 1855

I also have TS-830S that receives very good, but there is a problem with the outputs. When I got the 830, it was pretty well cooked. The PA section was all charred and the voltage regulator card was burned in places. I have since replaced the voltage regulator card and all of the burnt up resistors on the output pc board. I have tried to follow the schematic and rebuild the PA section(obviously, someone had hacked it up pretty bad.Things were just not where they were suppose to beaccording to the schematic and there was evidence of poor solder work. I suspect it was an attempt to 11 meter it), but without any photos or other examples I am not sure it is right. When I turn the switch on on the back of the unit, the 6146s start to glow orange. Also, the tall ceramic coil in the cage is charred pretty well, but it does not check open. I have tried to isolate this by using a variac, but no luck. So, I have continued to use my TS-450S/AT in the meantime. I would really love to get the old TS-830 back on the the air, though. Any help would be greatly appreciated.

Regards,

Richard KI4BFC /AE!!!!

Peter you can find a jpg of the schematic on the
"rube" webpage. I also have a djvu copy of the manual
showing the final unit x-ray view of the board. It's
on page 11 in my manual tho the page may not
correspond with the printed manual

Page 11 of the service manual shows the PA board layout, which I have done. What I am looking for is more of a topside photo of the PA cage that specifically shows all of the point to point connections of the resistors and inductors.

Thanks again,

Richard KI4BFC /AE

1865. Adding IF ouptut(s) to a TS-530 to use a SM-220 with a BS8?

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-06-17 14:31:41 UTC
From: kt4xw
Topic: 1865 Message: 1865

Hello,
I would like to use a sm-220 staion monitor with my ts-530 but I cannot find connection diagrams like the ones shown in the sm-220 manual for the ts-530. The manual has a great explanation of the connections for a ts-820 ,ts-830,and ts-520. I have the bs-8 pan adapter installed. I also have the owners manual and service manual. Any help would greatly be appreciated.

Thanks,
Keith Spainhour, KT4XW

Keith:
I am no expert! But as I recall when I had mine (220) there was a mod that had to be made to one of the rigs. (I think it was adding a cap or something like that). Also you might have to use the BS-5 instead of the BS-8.
It's been awhile since I owned mine so maybe someone can add better comments, or advise me that I am all wet! Read the back pages very carefully (even though Kenwood can't spell worth a darn.)

Subject: [TS-520_820_530_830] Adding IF ouptut(s) to a TS-530 to use a SM-220with a BS8?

Hello,
I would like to use a sm-220 staion monitor with my ts-530 but I cannot find connection diagrams like the ones shown in the sm-220 manual for the ts-530. The manual has a great explanation of the connections for a ts-820 ,ts-830,and ts-520. I have the bs-8 pan adapter installed. I also have the owners manual and service manual. Any help would greatly be appreciated.

Thanks,
Keith Spainhour, KT4XW

Get it after the detector and before any audio amplifying stages. You can probably use IF Output 2 jack.

Check to make sure you don't have excessive screen voltage and also check for adequate negative bias on the grids of the 6146's. Not enough negative, zero, or positive voltage will light those suckers up, orange and then red, but only for a short time. If it's happened several times already, you may have already kissed those tubes good-bye.

The service manual includes assembly/parts layout board drawings plus there are hardware layout drawings along with all the rest of the typical
service info you need.

I also have TS-830S that receives very good, but there is a problem with the outputs. When I got the 830, it was pretty well cooked. The PA section was all charred and the voltage regulator card was burned in places. I have since replaced the voltage regulator card and all of the burnt up resistors on the output pc board. I have tried to follow the schematic and rebuild the PA section(obviously, someone had hacked it up pretty bad.Things were just not where they were suppose to beaccording to the schematic and there was evidence of poor solder work. I suspect it was an attempt to 11 meter it), but without any photos or other examples I am not sure it is right. When I turn the switch on on the back of the unit, the 6146s start to glow orange. Also, the tall ceramic coil in the cage is charred pretty well, but it does not check open. I have tried to isolate this by using a variac, but no luck. So, I have continued to use my TS-450S/AT in the meantime. I would really love to get the old TS-830 back on the the air, though. Any help would be greatly appreciated.

Regards,

Richard KI4BFC /AE!!!!

Thanks, but I'm not the guy asking for the info. I already have most of
Kenwoooood's service manuals. And, yes, it's page 11 in both places,
since the djvu copy was scanned from a manual.

I recently found 24 brand new GE7054 tubes. I was told by a friend
that they were a replacement foe the 12by7a tubes for use in radios
and are rate 13.5 filiament volts compared to 12.5 in the 12by7s.
Anyone know anything about these tubes (Bill).? I may have a find here.

Tom

The specs for both tubes look fairly close. The 7054 was also known as
the 8077.

Jon,

The first place that I would try would be the emitter of Q3 on the AF Unit (the terminal that connects to R34). This is part of the AF amplifier that drives the top of the AF Gain potentiometer. The pot is actually driven off of the collector of the transistor. R34 provides some emitter degeneration, so it is a nice low-impedance point to pick the signal off, and it won't load the drive to the pot.

Let me know if it works...

If you have difficulty getting to the aforementioned point, you could always try terminal 3 of the AF pot (but you will want to minimize loading).

thanks Alan, i'll try and get to Q3 on the AF board, although theAF gain terminal woldn't be much of a problem as i'm planning to use a 741 op-amp ic as a buffer anyway.

regards and 73's

Hi All,
speaking of "peeing on the electric fence" when I was a boy aged 17 and I had been
in the army as a boy entrant since I was 15. We were doing an exercise before we all got
posted to our regular army units in Germany. I was operating the HQ station in barracks
and had a 40 foot vertical up outside the radio room. We had put up some red and white tape
around the antenna to keep people away from it. In the barracks there were some workmen doing
some building and drains work and at about 23:00 one Saturday night I was sending a message to
one of the stations in the field and one of the Navies, who was Irish, came back into camp
where they were staying, rather worse for the drink ! You've guessed it, he decided to relieve
himself against the antenna, we'll never know why he climbed over the tape. Unfortunately for him
I was still transmitting and he must have wondered what hit him ! I went to see him in Plymouth
Hospital the next afternoon with a couple of my mates and while he could see the funny side of it
he did have some nasty RF burns to his private parts.

Have a nice weekend everyone
73 de Bill G4KKI

Hi there,

Is there any reason that I wouldn't want a TS-830S instead of the TS-520 with CW filter and display output that I have now? There's one for sale locally with the mic and I'm tempted to get it then sell my TS-520. By the time I buy a digital display ($60 or $150) and an MC-50, it'd probably be cheaper in the long run to buy the other radio and sell this one.

I've read about the 830s' flaky display and a No Ox fix for it.

Any input is appreciated.

Thanks,
Jason

I can not think of any reason you would not want a 830, I have a 520se
- 820 - 830 and they are all great in there own way, of course the 830
tops them all, has the notch and vbt and if shift plus warc bands.
Just one of the best kenwoods ever made. I have never had what I would
call a problem with any of them. Had to clean the band switch on the
830 and 820. The 520se has never had the cover off and was bought in
1980. I use a mc-50 with all of them, you may want to pickup one.

1883. TS-820S vs.TS-520 - Wrong Model

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-06-18 19:23:11 UTC
From: Jason Creager
Topic: 1853 Message: 1883

Sorry, hit the wrong key.

It's actually an 820S that I'm considering.

Thanks,
Jason

IF shift, Notch filter and a whole lot tighter RX. The TS-830 was the top of the line in its day. I have a fully filtered FT-1000MP and it is just nice to turn on the 830 for fun.

Subject: [TS-520_820_530_830] TS-830S vs.TS-520

Hi there,

Is there any reason that I wouldn't want a TS-830S instead of the TS-520 with CW filter and display output that I have now? There's one for sale locally with the mic and I'm tempted to get it then sell my TS-520. By the time I buy a digital display ($60 or $150) and an MC-50, it'd probably be cheaper in the long run to buy the other radio and sell this one.

I've read about the 830s' flaky display and a No Ox fix for it.

Any input is appreciated.

Thanks,
Jason

Why sell the 520 ? Unless you need the money for the 830, keep it. I have a 130, and a 530, and am looking for a nice clean 830 for a decent price. When you get the VFOs, ATs, and speakers to match. WOW Now that is rig personality. These new radios are great, sure, but it's like set it and forget it. Soon Ron Popiel will be on TV trying to sell his version. Just compare the sound coming from a 830 vs. a new model high tech rig. That's just my opinion, but I know I'm right. HI HI 73 Mike KB3LAU

I have an 820s and can comment to that. Two problems. One you mentioned which is the display. I have not had that problem but there was a note in the manual that a new one was put in a few years ago when they were still available.

The other is that the T/R relay will wear out. Mine did and cleaning was good for three or four weeks and then out again. I did find one supplier on the planet and bought a fair amount of what he had on hand. Other than bandswitch cleaning, a really nice radio. The receiver is a little sharper than my new icom 718, which a great box for the bucks.

Don't think so! The 6146 and 6146w have 25 watt plate dissipation rating
while the 6146B has 35 watts. Unless you need the more rugged tube for
mobile use, the B version will give you a bit more safety factor.

Before we beat the 6146 issue to death again, read this article,
http://home.comcast.net/~zcomco/The_6146_Family_of_Tubes_1.htm

Beyond a certain date code, 1964/65, 6146W's were equivalent to the B's.
But, do you think the guy at the other end of the QSO is going to see a
difference of 10 or 20 watts? Use a good pair of 6146A, W's, B's, or some
of the other 4 digit equivalents.

Pete, wa2cwa

>Why sell the 520 ? Unless you need the money for the 830, keep it.

It's actually an 820S and I would need the money to pay for it. A guy locally has one with the MC-50 mic (which I don't have), so I figured I could sell the 520 and "upgrade" to the 820S and get the mic and digital display for less money than if I bought the $60 AADE display and the mic...and if it's a better rig, then great!

Being completely new to HF, I'd really like a digital display to keep me from making mistakes. Having 160M would be a nice option, too.

What's the impedance required for a TS-520 microphone?

My loaner President mic is 500 ohms. Since I'm getting no output and I think I'm tuned right, I'm suspecting the mic.

Jason,

I believe the mic impedence for the TS-520 is 50 kohm. I use an MC-50 desk mic which is 600 ohm/50 kohm switchable but fist mics are still available.

Ian (G0IHK).

From: mrogoff@cesmail.net
Topic: 1853 Message: 1895

A better place might be to find the connection to the volume control. One side of the volume control should be ground and the other side should be hot audio at a constant level. There should be some audio amplifier stages feeding the control so the connection there should not disturb anything. The closer you move to the antenna the more trouble you can cause by tapping in. If you tap in to the audio output of the demodulator you upset its operation.

From: Budd Turner : N7EOJ
Topic: 1853 Message: 1896

If the TS-830 is reasonably priced, get it.
Operate them both side-by-side and see for yourself.
I had a TS-520, two TS-820s and two TS-830s.
I sold the TS-820s first, then the TS-520, although I miss it.
I did the Kenwood International User Club receiver mods and added narrower filters to the TS-520. It received better than the TS-830 and consistently received better signal reports in comparison transmissions.
You can always easily sell either.

Budd

Topic: 1889 Message: 1898

While I agree about the Extra remark, your lack of HV readings is probably very simple
to solve. I would recommend you get a copy of the service manual for the 520 and look
at the meter switch and solve the problem from there. Be careful, 900 vdc can kill and
if not killing you, will certainly hurt.

Kenwood used the Japanese S2001A's in the 830S and a number of their other rigs. Their claim was that the S2001A was electrically equivalent to the 6146B. Currently, it's your job to figure what's best for you. If you use the 6146A's or the "early W's", you just don't load it (plate current) as high as the B's or "B equivalents". That additional 20, 30, 40, or 50 ma on the plate meter won't make any difference to the guy at the other end with any of the tubes. I generally load my 830 to about 200 ma and the B's have been in there since 1989. The 6146's are hardy tubes and you really have to push them to extremes before they drop dead. Generally the extremes also include popping some resistors, charring the board, frying components in the power supply, churls of smoke seeping from the vent holes, etc. etc. I think I just described an 830 modified for CB.

Pete, wa2cwa

1902. TS-520S Tuning Dial Stuck

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-06-19 20:10:36 UTC
From: Keith Hanks
Topic: 1902 Message: 1902

I just bought a second TS-520, the S version, to have the portability of 12V operation. It just arrived and everything LOOKS ok except the tuning dial won't move. The Main tuning knob turns but the Dail scale and the Sub-dial both do not move. It was represented as good condition when I ordered it and perhaps it got bumped in transit. At this point do I declare it DOA or are there any suggestions as to how to get the thing unstuck?

I haven't tried powering it up yet.

Thanks for any help.

Keith Hanks

There is no copy of the TS-520 User Manual...yet. There's one for the 520S and it "works", but the knobs are different and it's not exactly the same.

However, I purchased a 9+ condition manual from eBay and hope to have it .PDFed in the next week or so depending on whether or not my scanner still works.

Jason et al.
If you need a manual for that radio or other radios
for that matter your best bet would be to join the
yahoo group hamftp.
If the manual isn't available just post a message to
the group. Helpful bunch of hams there.
I have the 520 manual as well as others that i will
make available on the ftp server or "rube"
I will upload to the server later on this evening or
tomorrow if it is not already there.
Take care
Robert

Not if they're S2100A.

As indicated on all the schematics and parts lists for the TS-520 series, 820 series, 530, series, 830 series, and T-599 series, the final tubes were S2001A's.

1909. Tuning a TS-520 SE and TS-520 S

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-06-20 05:29:23 UTC
From: Keith Hanks
Topic: 1909 Message: 1909

I have been following several of the posts about tuning. I have generally been using 20 meters and tuning into the dummy load on my MFJ 949E tuner.

At 14.3265 I had the following results:

IP w/ USB 60 mA, IP w/ CW 70 mA

ALC,TUNE, ALC peaked at 2/3 using Drive, CAR about 1.0

IP, TUNE PLATE dipped at 50 mA mark w/ PLATE indicator at the "1" in the "14" and LOAD way counterclockwise

RF, CW PLATE to left end of solid white line under 14, LOAD at 10 o'clock, output 280 mA on scale and 100 W on MFJ 949E Tuner Scale When I flip the standby switch to send nothing happens. I have to key the CW key to get anything to move. Am I doing the right thing, or am I killing something????

With my antenna tuned for 40 M and the dial set at 7.330

IP, USB 60 mA

ALC, TUNE ALC peaks at 2/3 scale w/ CAR at about 0.9

IP, TUNE 50 mA, plate dip pronounced at mark between 3.5 and 7

RF, CW No response????

On 20 M with mike gain set so that peaks go to full ALC scale it looks like I am putting out about 30 Watts peak. I am wondering if I have killed the tubes.

Thanks for any guidance.

Keith

1910. 520 Tuning Questions

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-06-20 09:44:16 UTC
From: Jason Creager
Topic: 1909 Message: 1910

Hi there,

A couple of questions. First, RF Gain down, Needle up? Is that what's supposed to happen?

Following the tuning procedure in the manual:

When I get to the Plate/Load tuning and flip to SEND, the needle pegs instantly. The RF Volt adjustment has no affect at all. It's hard to "peak" when it's already pegged!

When I tried to transmit earlier today, I the Forward meter on the tuner registered about twenty watts. Could that be a SSB thing? When I'm connected to the dummy load, I get much, much higher readings for forward and reverse.

I haven't yet tried to tune it following KG6HAF's webpage, so perhaps there's some step that I'm missing or incorrectly interpreting from the 520 manual.

Also, what kind of connector do I need for my key?

Thanks,
Jason

Looks like one of your counter or display memory chips
is bad.. decoder I mean... you will have to do some
digital sleuthing.

From the numbers, I can't discern a pattern right off
the bat. Get the schematic and look at the bit
patterns that are set up for a certain display. Start
at zero since that seems to be working.

You can run right up to where the digital readout
begins to be mux'ed for the display; if you don't find
anything up to that point, I would be surprised. Once
it's muxed, the display should get all screwy if it's
a multiplexing issue.

To: TS-520_820_530_830@yahoogroups.com
Subject: [TS-520_820_530_830] no HV meter Reading

Ok, I just got my 520 out so I could play with it since I just
upgraded to Extra. So, I tune it up and it does tune up normal and
it shows about 120 watts out and all the other meter readings work
but when I turn the meter to HV it goes to 0. and to be honest I
don't remember if it ever did show anything.. I haven't used this
520 in a few years. The SG switch is on and the tubes are glowing.
Any ideas?

hi jason,

For anyone reading this here is the link to kg6haf site

http://www.kg6haf.com/kenwood.html

If RF gain in ccw full then yes, meter will move up this is normal.

Please set AF gain to about 1-2 and rf gain full clockwise.
you will see the meter return to low end scale.

also remember that you need to be in transmit mode to get
hv adn rf meter readings.

The RF volt adjustment is only for meter calibration,
will not adjust the rf voltage circuits.

Try to follow the instructions on kg6haf site first,
it is very good info.

Remember, in ssb your wattmeter will not give true reading of
your output power unless it is peak reading meter.

Now, if you are in cw mode then the wattmeter will give correct
readings.

Here is hint that I use, DRIVE PLATE LOAD that is it !

Also when you dip/peak use fine adjustments on the above controls,
otherwise you can go past the proper settings.

When you get it tuned in, make notes on the settings so you can
return to them the next time you use that band. A quick check is all
you need to do later.

For the cw key plug you need the standard 1/4" phono type.

hope this helps.

That's good to know that I can't burn out the tubes by misadjusting it,
then.

>Try to follow the instructions on kg6haf site first,
>it is very good info.

I did that afterwards. The meter still instantly pegs when getting to the
"twiddle the Plate/Load" controls.

>When you get it tuned in, make notes on the settings so you can
>return to them the next time you use that band. A quick check is all
>you need to do later.

That's great to read. It seems like I'm constantly adjusting the IP,
though. Is that normal?

1919. Still No ten meters on 830

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-06-21 18:38:28 UTC
From: ka9vaa
Topic: 1919 Message: 1919

Ok, this is what I have done, tried t clean the band switch with deoxit, retuned all drive coils using the settings in the maintenance and alignment section of the manual. All the coils responded except for the 28 coil, nothing at all, I wonder if it isn't the switch or is there something else I should look for?

Thank you all for any suggestions.

I was just checking into doing exactly that, eg:
dropping the HC-4 into a D(as in DEAD)-104. Heil no
longer sells the element seperately. I haven't asked
him why.

BTW, sorry to dupe if this info is already out. I'm
1.63 weeks behind on my e-mails, as usual.

1921. TS-820s with VFO-820 Relay Cahtter

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-06-22 09:38:53 UTC
From: Greg
Topic: 1921 Message: 1921

73 all...
Been a while since I turned on the 820s. Noticed no digital display and suspected typical connection problem at VFO Plug/cable from rig to exterior VFO. (vfo-820)
At some pointed , when moving VFO to check cable, saw a spark when chasiss of VFO-820 touched RIg..(That CANT be good) Found broken lead in VFO plug , so suspect it shorted to another pin on the plug....

OK, NOW I find, with VFO-820 unpluged, rig ok. Pluging in VFO-820 (using now repaired cable) produces relay chatter of the RL relay on rigs relay board X43-1190-00. As most know, the plugs used for the VFO-820 dont always make good contact, and by accidnt, I found pulling plug slightly out,(discontectiing some of the pins) stops chatter, but also turns off dial light in the VFO-820.(yet vfo-820 sems to still work in changing freq dispaly)

Pulling the relay on the rigs relay board also stops chatter (obviously), and VFO-820 seems to still work ok, but no dial light.

Heres more info: with relay unplugged, only getting abt 2-3 volts at coil socket when tested. With relay and VFO-820 plugged in and rig in transmit mode,(finals off or on), dial lights in VFO-820 brighten as if over powered, and relay chatter stops.

I suspected it may be zener diode on the relay board, as with board pluged in, it seemed to read voltage drop in both directions... BUT by unplugging relay board completely, zener now seems to test ok, again by simply using diode setting on a DMM. (I realize this isnt the best way to test a zener)

Something is obviously "open" somewhere causing this strange relay/ over and under voltage problem. Also I have noticed the relay in the VFO-820 doenst seem to activate as I recall it use to when turning it on.

Hope this far-out discription can help someone set me in the right direction. I am not a tech, so excuse my thinking so far.

TNX for any suggestions on where to start looking....and watch-out for those flaky VFO plug connections!

1925. Anyone have a spare tube set?

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-06-23 00:11:56 UTC
From: Jason Creager
Topic: 1914 Message: 1925

Hi there,

I assume by the hot smell after I accidentally tuned my 520 into the G5RV instead of the dummy load and the no meter response even with the carrier all the way up that I've blown the tubes. *sigh* This right after I missed out on an Icom 718 for $275 on eBay by mere seconds last night.

Does anyone have a spare set? Do I need to get the driver tube, too? Recommendations? I'd *really* like to get this damned thing on the air!

There is a board called the HV Unit (X43-1100-00). It's a small board. There is a voltage divider network on this board. There are three 680K resistors (R2, 3, and 4) connected in series to the 800 high voltage lead. On the other end of these three resistors is connected another resistor 100K (R1) and a .01 mfd capacitor (C1) and the meter lead for HV. The other end of the 100K resistor and .01 mfd capacitor are connected to ground. One of the 680K resistors could be open causing no trickle of voltage to get to the meter lead. If R1 was open you would most likely peg the meter. If R1 or C1 was shorted to ground, the meter most likely would not move.

The final tubes in this thing can take a lot of abuse. You could probably load the 520 into metal bed springs for a short period without the rig burping too badly. Is the HV switch on? Is the SG switch on? Are the tubes lit? Do they glow orange/red after a short period of key down? Why wouldn't you tune your 520 into the G5RV? Is there something wrong with it? Tubes generate a lot of heat and after 25 or 30 years things can "smell hot". Did you see smoke or blow a fuse? A tube tester also helps to determine if the tubes have failed.

Unless you tuned for a hugely long time at high power, you probably
damaged something other than the tubes, especially if you output is zero.
You'd better troubleshoot a little.

Bill, Here's an update to an old problem I never got around to fixing until I had the rig open for another recent problem. (You may have read abt my VFO-820 problem...it was a broken trace on the bottom of the VFO-820 Board.. amazing story of how it was tracked down, which unfortunatly didnt get sent to the group, for some reason)

While I had the rig open, I checked out the resistors in the volatge didvider cct board as you suggested. As first I saw I was geting strange readings, probabbly due to the capactor in the cct. I pulled the 2- 56K resitions, as one was suspecious, although it wasnt not reading open or looking burnt.

Even with it out of the cct, one of those reistiors was giving a strange effect on my DMM...climbing in reistance then going back down...this is without anything else connected to it!
I replaced this "possessed" resistor and was VERY happy with the results......a full 10 watts of tune power now, where none (or VERY, Very, little) had existed, since I bought the unit 2 yrs ago....

TNX for setting me in the right direction.....I am really on a good run..just fixed my VFO-820, after it showing really strange problem.

Also repaired a tune-up impedence bridge/dummy load, I made some time ago , that wouldnt show a flat tune setting for my antenna tuner. (that problem, I found, was caused by a wire-wound resistor that was disguised as a carbon...lesson learned there! You can never tell the composition of a resitor)

Also, the coax shield inside, used for part of the bridge cct, was grounded to chassis and causing some capacitance to the cct, which was throwing off the readigs....Cutting shield form chasiss removed the small amnt of capacity...keep this in mind everyone, when building some antenna type ccts....

73 Greg
VA3VFO..... A happy self learner, with tnx to the group!

Checking a zener on the "diode" range of a DMM is
valid. Most zener failures are to a dead short; so a
good zener will test as a good diode.

I have never seen one fail as to shift the zener
breakdown voltage; so the DMM Diode test works well if
in-circuit voltage test is not practical.

Sorry about your post not making it; was not moderator
action I don't think.

1932. Bleat on battery versus tone on mains

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-06-23 04:39:42 UTC
From: Jack Twilley
Topic: 1932 Message: 1932

I'm preparing my station for Field Day, and one of the things I've finally done is to purchase and install a PWRgate40 which acts as a DC UPS -- it switches from mains to battery when the mains fails. When I tune up on mains, I get a solid normal healthy tone and lots of power. When I tune up on battery, I get a bleat sound like an injured chicken and much less power. I measured voltage drop from battery to radio and it's less than a volt. The battery has been charging for a week, and it is brand new. What could be causing this problem?

Jack.

>load the 520 into metal bed springs for a short period without the rig
>burping too badly. Is the HV switch on?

I kept the tuning periods as short as possible, probably less than ten
seconds a piece.

> Is the SG switch on?

Yes

>Are the tubes lit?

Well, they glow when the heater switch is on. One glows brighter than the
other, but neither are as bright as the driver tube. I take it that's a
good sign. Do I still need to have them checked?

>Do they glow orange/red after a short period of key down?

Unknown

>Why wouldn't you tune your 520 into the G5RV?

Because you're supposed to tune into a 50 ohm load not a badly mismatched
G5RV antenna. I can't remember what band it was tuned for, but it wasn't
the right one.

> Is there something wrong with it?

>Tubes generate a lot of heat and after 25 or 30 years things can
>"smell hot". Did you see smoke or blow a fuse?

I didn't see any smoke, but got a very strong smell that something just
went south.

>A tube tester also helps to determine if the tubes have failed.

Good luck finding one of those in Las Vegas.

On 6/22/04 at 6:30 PM Paul Manuel wrote:
>Unless you tuned for a hugely long time at high power, you probably
>damaged something other than the tubes, especially if you output is zero.
>You'd better troubleshoot a little.

I'm printing out the service manual right now. Considering my lack of test
equipment, knowledge of older electronics, and the list of things that
could be wrong, I think I just wasted a lot of money on my first HF rig.

1934. Non Transmitting 520 Update

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-06-23 07:57:39 UTC
From: Jason Creager
Topic: 1914 Message: 1934

Well, I just fiddled around with it. Here's a few more pieces to the puzzle.

There's no receive audio at all on any band.

Also, when I push the WWV button the needle moves all the way to the right as if the RF Gain was turned all the way down. The WWV button has always been "scratchy" sounding when pushed. The only thing that jumps out at me as being on both the Receiver and Transmitter troubleshooting guides is the relay in the final. I'll take it to work tomorrow and give it a once-over.

Could it possibly be that easy to fix? I can't imagine that it would be or that the relay could've generated the "hot" smell since it looks pristine.

On the upside, I discovered a Magicom speech processor board on the bottom when I opened it up.

Any thoughts are appreciated.

Jason

1935. Re: TS-820s with VFO-820 Relay Cahtter

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-06-22 11:06:51 UTC
From: Greg
Topic: 1921 Message: 1935

NOW YOU'LL KNOW "THE REST OF THE STORY!"

1 hour after my original post.

Well, to all those aspiring new Hams....it is possible to fix your own rig with a little logic, observation and patience....and having a boat anchor sure helps...

I opened up the VFO-820, and thinking a voltage spike may have taken out the one diode I saw, upon testing, found a crack in it. Did I do that when testing it? I'll never know. I replaced it with a general purpose diode, but still got the relay chatter, but now it came from the relay in the VF0-820....While poking around with test clips, to test the pre-installation of the replacement diode, I noticed some intermitant behaviour.

For a brief second, everything went "quiet" and worked fine....I decided to pull the small board for a look,(and to hard wire in the replacement diode)....Turning the board over, there it was....a break in the foil trace!...And it was a good sized one too! A good portion of its length was lifting off the board as well. Could this have been caused by the short I "saw"? Had this been a weak spot and the short to ground "finished it off"?

Maybe...but it also seems to coinside with the metal bracket that holds the cct board in place. I had bought the VFO-820 used and maybe someone had been over ambitious in tightening the screw that is on the cct board over the bracket, there by ripping or crushing the cct trace....or maybe they slid the board across the metal edge while working on it....At any rate, I repaired the broken trace and upon pluging everything in, saw dial lights at the correct brightness, heard no relay chatter and had happy tuning!!!

The End.
The names of the characters have been changed to protect the innocent)
P.S. Keep this metal bracket in mind when working on your VFO-820.

1936. Re: [TS-520_820_530_830] ip setting ts 520

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-06-22 12:03:14 UTC
From: james27613@att.net
Topic: 1936 Message: 1936

hi jason,

You set the IP adjustment only once when you first get your radio
and should not have to adjust it unless something has been replaced or
causes the IP to go out of adjustment.

page 21 in the operatin manual has procedure to adjust the
IP to 60 ma. Then your all set.

Please check the table on top of page 21 to verify your switch
and knob settings are correct for transmit mode.

Are you using a good dummy load or are you using antenna directly
during your testing ?

Also, when in transmit mode CW you should see the IP reading
aroung 200-250 ma or so this is normal. 200 is fine, nobody
will notice the difference from 220-250 and it keeps the tubes happy.

Hope this helps you out.

Yeah, could be a waste. But consider what a "radio repair course 101 and 102" would cost at the local community college would cost. Including books. You got a bargain.

Now for step by step t'shooting; get the rig set up, covers off, in a place that it won't be in the way or disturbed in between fixit sessions. Then, go to the cupboard and get out a healthy dose of patience. Find any ARRL handbook from 1955 to 1969 and go through the vacuum tube chapter; learn what the cathode, grids, and plates or anodes look like, and how they make the tube work. Learn about screen voltage, grid bias, how indirectly heated cathodes work, and particularly how we use grid current to determine when a PA tube is being overdriven (this will relate to the ALC function in your rig and will have a bearing when you get some output and start tuning up). If you already know this stuff, great.

Make sure your DVM and soldering iron are working; now let's get to work.

First of all, and the other group members may differ with me; the best tube tester is the rig itself. In the rig, the tubes are in their normal environment.

Next thing to do (notice we have not fired up the rig yet, even!) is to do a good physical inspection. Not everything (there's a lot to look at), but just some critical components; the ones most likely to blow up. Then we will talk about why they have failed, if we find anything.

Look at all resistors in the bottom of the PA section, around the tube sockets. Also look at any power-supply looking thing. Tell us what you see.

Jason.....dont think like that! I have no formal electronics educaton
and have learned by the seat of my pants....Ive fixed some rig
problems that I was at first sure would require a tech...BUT use your
logic, and keen observation. I find most problems have a "mechanical
or connection " cause. (includes when they are shorted or blown open)

Use the "What has changed or, what did I, or the rig, do diffrerntly
since the problem started" way of thinking. The 820 et el line of
rigs is great to work on, for the beginner.

I have no test equip other than a DMM, and have used it to find many
problems. Also, don't always believe what you see...exapmle is:
although a resister may "appear" not to be burnt, it can indeed be
defective....etc...

Good luck, I know you can do it, but confinence is a must....
Ofcorse, there are problems beyond me, esp around IC's and
transitors , but with help from groups, I even have repaired an FT102
with defective transistors, agn without any fancy test equip...just
subsituting the suspect part and "bingo"....it will be a "rush" that
will keep you wanting to repair any problem you may encounter!

Good Luck
Greg

I would make sure all of my DC connections are the
lowest resistance possible. Starting that
multivibrator takes a pretty good current spike...

Do you have the negative lead fused? If so, remove it.

I haven't yet checked resistance, but I did check voltage drop, and it
wasn't measurable with my equipment.

K0ZL> Do you have the negative lead fused? If so, remove it.

Here's what I've got:

Battery Poles -> 4' 10ga (positive fuse) -> RIGRunner w/circuit
breaker -> 6' 10ga -> PWRgate40 -> 4' 10ga -> RIGRunner w/circuit
breaker -> 4' 12ga -> rig

I can try taking the RIGRunners out of the circuit for testing
purposes when I get home. That'll also remove a couple of lengths of
10ga if that matters.

hi jason,

Don't painc, take things slow and you can get the
radio running again with help from the group !

You don't have to be an expert to make the basic
repairs to the radio. Some tasks like alignment requuire
special test equipment but you can troubleshoot the radio
with your basic meter.

Keep in mind if the radio was in storage for a long time
the failure could have happened if anyone started to use
the radio !

Take your time and with power off and look inside for
any signs of damaged parts. Use a magnifier if needed.

Also use your nose to sniff out anything that could be
burned up.

Watch out for high voltage inside the radio.

Is the cooling fan running ?
a few drops of oil in the bearings is ok to do.

Is inside clean or lots of dust ?

Post back what you find.

Should you need tubes, http://www.surplussales.com

1947. Transverter Connections for TS-520SE

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-06-23 22:54:24 UTC
From: Brent Baum
Topic: 1947 Message: 1947

Just an update to the group on how the project is progressing.

Inspection of the inside of the radio revealed that all the circuit board connections continue to exist with the SE model, Kenwood elected not to bring them outside the box, and never connected anything at these points.

To continue I need help with the following:

1. How do I determine which is pin 1, pin 2, etc. on the TR relay? I'm not familiar enough with the component to tell.

2. I understand the schematic, but because I'm a little out of practice, I need a drawing or description of where the wiring from the TR relay and the Xverter switch physically connects within the radio; that is where are the connections made inside the 520S? This is important because the relay and switch interrupt some pretty important circuits.

3. I'm having trouble locating duplicates for the odd ball 12 pin connector block and cable plugs that Kenwood used for the xverter control connections. I suppose I could go to a modern computer type DIN or molex connector but that would detract from the vintage flavor of the radio.

Thanks group for all the help.

1948. MH4P Relay Pinout

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-06-24 02:34:36 UTC
From: Jason Creager
Topic: 1948 Message: 1948

OK, so the relay under the finals is a Four Pole, Double Throw relay. The coil is good.

Does anyone have the pinouts for it? I'm figuring through it by looking (and guessing at the "lever" for the switches), but I'd like to double check my results. I'll post them when I'm done.

Here's what I came up with:

16 9 10
14 15 8
13 6 7
11 12 5

Coil 1 4

The center pins are the commons.

The switches are grouped just like the outside rows of pins.

9 is common to 16 & 14 (NC)
15 is common to 10 & 8 (NC)
6 is common to 13 & 11 (NC)
12 is common to 7 & 5 (NC)

I think this is a 12V coil. Is this correct? Does AC or DC matter? I'd like
to check and make sure the NO contacts.

1953. Back to basics

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-06-24 20:08:16 UTC
From: kenwould520
Topic: 1953 Message: 1953

O.K. Guys...Back to basics then on an atenna. Hypothetically I have thrown up a vertical rod of some 8 meters in lenght. Well insulated and with a good earth nearby. Given that this earth is sufficient enough to act as a "Ground Plane" and that the insulation on my "pole" is more than adaquate. How do I measure the impedance of such an aerial.
I would use a short length of 50 ohm coax to a transmitter eventually, but at this initial stage need to know what the impedance is. What sort of meter do I use?

1954. Re: Back to basics

Yahoo group: TS-520_820_530_830 (2001 — 2004)

From: Jim
Topic: 1953 Message: 1954

There are special meters designed just to analyze this. Remember
that there are two components to impedance - resistance and
reactance. MFJ makes a complete line of antenna analyzers, but the
nicer ones tend to be kind of expensive ($300+). You might stop by
Field Day this weekend and help the local club set-up. Chances are
you will find somebody with an antenna analyzer and they might be
kind enough to give you a hand with it, not to mention some personal
lessons on the fine art of antenna voodoo.

73,
Jim

You don't need any test gear. The impedance of a
vertical against a perfect ground plane is 36 ohms,
half that of a dipole in free space.

That's only at resonance, and I think at odd
harmonics, no?

If not at resonance, get that MFJ antenna analyser...
the one that draws the graph for you, I think it's
about $260.00 and good investment for anyone playing
with antennas. Gee, that would be all 1710 of us here,
wouldn't it?

We in de wrong business, boss.

All verticals (1/4 wave) are as Bill states 36 ohms. Verticals are also known as Mono-poles.
Since it is only 1 element vs a Di-pole (2 elements), it is half the feedpoint resistance. A Di-pole
is typically 72 ohms.

Therefore, with an 8 meter height or 26.2 feet in length, your vertical should be resonant at about
468/18=26 feet or about 18 mhz for a 1/4 wave vertical, provided you have a good ground radial
system. I would seriously recommend the MFJ antenna analyzer also.

I'm a newbie looking for:
1. TV-502 control cable to TS-502;
2. TV-506 control cable to TS-502;
3. Same cables to a TS-830S.
Please advise if you have, or know of source & costs for these
cables and/or the 12 pin connectors (Kenwood part #E09-1204-05?).

Many Thanks & 73,
KG4YUP/Railey

And also.....

I forgot to mention, you can feed this antenna directly with coax. The SWR will be about 1.5:1 very good.

Again this is at 9mhz or somewhere around there. Use the formula 234 / (Frequency in MHZ) to obtain
your likely resonant frequency. BTW, a meter is 39.37 inches in length. Divide that by 12 and get your
length in feet. In addition, insulation of the wire really doesn't mean anything unless you are running very
high power and are afraid of setting something on fire. Insulation on the wire also affects the resonant
frequency of the antenna.

Subject: [TS-520_820_530_830] Kenwood Converter Cables

I'm a newbie looking for:
1. TV-502 control cable to TS-502;
2. TV-506 control cable to TS-502;
3. Same cables to a TS-830S.
Please advise if you have, or know of source & costs for these
cables and/or the 12 pin connectors (Kenwood part #E09-1204-05?).

Many Thanks & 73,
KG4YUP/Railey

I now get the bleat sound when keying up on mains power, and my MFJ's
power meter reads 50 instead of the 100 it normally reads.

This sounds to me like one of the firebottles has failed. Does that
sound right to you guys?

Jack.
(figures it'd happen the night before Field Day.)

Use the mfj tuner as a guide, dummy load first, low, low, power, correlate with the rig if has a swr meter, if not, uh oh! Which rig is it? this sounds a bit strange? If you are using an mfj tuner, do the silly stuff before panic. set your transmitter and antenna controls on the mfj to five and then flip through the inductor setting for best receive. Your antenna may have dropped altitude a bit or something, requiring you to move the inductor one setting.

You did not say which mfj tuner you have so I am probably making too many assumptions that you may have one of their """""""better""""""" models, at least in price. I am comping to a 949. I use their stuff, I just know not to trust it!

It's a TS-520 -- I recently posted about the bleating being a new occurrence. I'm wondering if one of the tubes has lost its fire, and if so, whether it's safe to run the rig in a quasi-novice configuration for Field Day this weekend. I'm using the Versa Tuner II, and I've set the MFJ as per the directions (which is basically what you've listed above). The antenna was tightened, which caused the center of the antenna to drop a little, but I'm getting half the power I'm used to getting out of this widget.

PChapman> You did not say which mfj tuner you have so I am probably
PChapman> making too many assumptions that you may have one of their

I don't trust any of the knobs, dials, or lights on my rig lately. I hope I'm on frequency, and I don't transmit too close to the edges just in case I'm off.

Jack.

You can run with one tube, just determine which one is
bad and disconnect the anode connector.

You will be 1/2 "s" unit weaker... darn!

I bet the capacitors in the DC multivibrator circuit
are going bad... look for the mylar or polyester ones
that look like feedback caps in the circuit... should
be two of same value... change them both.

So, if it runs fine on AC, then, most likely, there's a problem in the DC
to DC converter. Sounds like your tubes are OK.

1971. TS-820 Help on TX/RX Response time

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-06-26 18:42:46 UTC
From: Donald Bryant
Topic: 1971 Message: 1971

Hello to all!

My TS-820 randomly takes about a second or somtimes two to go from TX to RX. The transmit drops but the receiver is still muted. Its not the vox or delay circuit and it does not do it all the time. But it can be annoying. It might be associated with the agc as whenn its slow it seems worse. Also with the mike turnned all the way down it will still do it when there is not any rf present. the relay is fine and working properly its like an agc type "inrush"when it comes back to receive and again its not during every transmit. Maybe 50% of the time and random. Any ideas?

I tried to download service manual and my adobe says its corrupt!

ANY IDEAS WOULD BE APPRECIATED!

Thank You

What adjustments should I make to my TS-830's controls when transmitting SSTV/Packet, the manual makes reference to no more than 125ma/ip, but i don't understand the relevence of this, could somebody please explain very slowly what I should be adjusting and to look for on the meter.

Excuse the simpleness of this question, but my 830 is the only thing valve driven(apart from CRT's) thing I have ever owned.

Your TR relay ala i think mh4p is dirty or done. Common issue after a few years. I was lucky to find a replacement, but there are notes on doing the business card/contact cleaner spray method that will prolong life for a while. Trust me, I know the aggrivation.

1974. Help with Transmit Line

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-06-27 14:32:59 UTC
From: k2wh_bill
Topic: 1974 Message: 1974

Apparently my VFO-820, has some kind of problem and has damaged (2) rigs before I knew what was going on. On both rigs, the FIX-VOX board lost components. Q9, D17 and R31 shorted and/or burned. R31 actually roasted, Q9 shorted and D17 opened. With these components damaged, I lost the ability to transmit. Receiving is fine. The damaged circuit seems to be a switch for 14vdc to the relay coil (RL). Diode D17 seems to be protection for back EMF from the relay coil.

I replaced all (3) components as follows:

Q9 with a suitable NTE device
D17 a 1N60 diode with a 1N34 device
R31 with a like value resistor.

Turned the rig on and I still have no transmit either with the mic or the Send/Receive switch on the front panel. I measured the relay coil and get somewhere around 380 ohms so I know the relay coil is OK, right? Can the 1N60 be replaced with a 1N34? I checked the specs on both devices and it seems the 1N34 can be used in this circuit.

Since I have spare components, I will replace the FIX-VOX board with another known working unit to see if that solves the problem. If not, does anyone have any ideas where else to look? I suspect since Q9 is a simple switch, there may be more damage on the board.

As a side, in the schematic of the radio there is a device called "CH" with "In" and "Out" labels? It is located on the schematic above and to the right of the right of the relay board. It seems to be a coil of some type but I am note sure and seems to be associated with the 14vdc bus. Anyone know what this device is or where it is in the radio.

I am not sure the "oddball" transverter connection is really 12 pins. I am pretty sure that Kenwood used a 16 pin connector and had a few spare pins. The connectors (I am pretty sure) are from a Japanese company named Hirose that made them for the Japanese telephone company NTT. The part number for the plug is P-1316-CTA which has a rear exit for the cable or you can use it's close cousin is the P-1316-CEA which has a side exit for the cable. The matching sockets are S-1316-CTA or S-1316-CEA. Original equipment was the CTA variety.

Minimum order quantity from Hirose is 1000 pieces, which at $11 each runs into some real money. The only source I have found that will sell in eaches is an outfit in Egham, England named Electrovalue. They have a website at:

http://www.electrovalue.co.uk/

I don't know if they still have stock available, but when I dealt with them they took my Visa card number and promptly shipped my parts out in a bubble envelope. As I recall, I had them within a week or so. Very nice folks to deal with. Price was UKP 11 or around $15 at the time, plus a few bucks for shipping. All in, I think I paid less than $20.

73 and good luck,
Jim

It is pretty much standard operating proceedure with all rigs to reduce the mic gain to below the ALC threshold to prevent intermodulation distortion and the resulting splatter when feeding digital modes into an SSB rig.

It should also be noted that normal SSB voice operation has much lower duty cycle than the alternating tones of the SSTV/Packet, so you need to reduce the dissapation of the tubes and the power supply otherwise you will blow the rig's fuse. The radio should be tuned up normally, with final plate and load tuning done (fully loaded) in CW, to the normal 225-235 ma ip/full RF output, then the mic gain will be adjusted for 125 ma ip in ssb mode with tone input. Also make sure your fan is clean, lubed and well adjusted.

You will find that even with the seemingly reduced output, that you will actually get a more error free link with a cleaner signal, and with the TS830 there will still be more power output than with any 100 watt Solid state rig adjusted properly for minimum IMD.

I suppose we should start from scratch. For whatever mode the
proceedure is the same. This assumes just about any radio with 6146B
neutralized pair and Pi network output matching.

1) LOAD control should be preset to minimum and PLATE control to the
intended band area.

2) Tune the VFO to where you want to operate and adjust the DRIVE for
maximum recieve (actually this is the preselector/driver tuning
control.

It really helps to have a wattmeter or SWR meter in line for tuning
for maximum output while the IP meter is selected. This way you can
see how maximum RF output will (or very nearly) coincide with dip in
IP. The radio should only be briefly keyed only as necessary to tune
each adjustment and watch meters. Once you know the normal position
for the adjustments for each band, you can skip most of this and just
go straight to CW mode and peak up the RF output and switch back to
IP to check that it is normal. This is no more trouble than tuning
an outboard antenna tuner on any newer rig.

3) With CARRIER and mic gain at minimum, and the mic keyed, you
should see 55 ma IP resting current (or therabouts between 50 and 60
will be fine at this point). There should be roughly 800v on the
Plate.

4) With the radio dekeyed you would initially set mode to TUNE, key
the radio and bring up the drive until the IP or RF output begins to
rise to 125 ma, and tune the PLATE for a dip in the IP, then tune
DRIVE then CAR for a peak in output power and dekey. The DRIVE
control peak should be very close to the best recieve. If it is not a
sharp peak, then the CAR control was too high. One could even skip
peaking the DRIVE until later if there is sufficient carrier to drive
the radio to full output for the final load adjustment.

5) With the radio now in CW mode and watching for RF output, briefly
key the radio by either the SEND or key down and increase the LOAD
while simultaneously peaking the PLATE for MAXIMUM RF OUTPUT and
dekey.

6) Look at the IP and breifly key the radio still in CW mode, you should have 225-235 ma IP. Slightly adjusting the PLATE should show that you are at or very close to minimum, and the dip should be very shallow. This indicates that you were fully loaded.

7) Now Switch to ALC metering and key the radio breifly while adjusting DRIVE for a peak in ALC while using the CAR to keep it downscale. Now go back to step 5 and make sure you are at MAXIMUM RF OUTPUT. Switching back to IP should show you are in the 125-135 ma. range. You will do this step as you move across the band, more so on 80 and 40 than on 20 meters, but you will find this to be no more trouble than using an outboard tuner on a solid state rig where you will be tuning for maximum RF output with minimum ALC (SWR shutback).

8) With mic gain at minimum in SSB mode, key the mic and see 55 ma IP resting current or find the adjustment near the fan on the back panel. This is not real critical and will fluctuate maybe 5 ma. 50-55 is fine.

At this point you are ready for CW operation or go to SSB and set the mic gain and processor adjustments for SSB operation, or for digital, turn the processor OFF and with a steady tone input reduce the mic gain for 125 ma IP.

There may be variations from the manual but I don't care. There have been various opinions regarding final loading in CW mode rather than TUNE mode. This is academic. Look it up in the ARRL Handbook if you want. A well neutralized PA with PI network output IS ALWAYS tuned for maximum RF output in order to fully load the PA and provide best linearity and harmonic rejection. This can't be done in the TUNE mode. TUNE mode is to insure the PLATE is not "way out of tune or the tubes will fry". If the IP dips way off afterwards, the tubes need to be neutralized. If the IP is too low, the antenna is not matched well enough for full loading.

As stated above, if you have already done this a few times and know where the controls should be, put them there and go right to step 2 and 7 and you're done. If you want to run low power just turn the mic gain down. I have full output from the same 6146B tubes that have been in the radio for 20 years. You should NEVER have to replace your 6146Bs ever unless you take it up to field day.

Topic: 1947 Message: 1980

Thanks, an internal picture would help, especially of the wiring connections to the t/r relay and the back of the transverter switch. The next most helpful thing would be to know the exact point-to-point wiring for the transverter connector, switch and t/r relay as set up on the S so I can duplicate it on the SE.

This is kind of like an old movie where the hero is trying to diffuse a time bomb...."red wire or blue wire?" :)

1981. RE: [TS-520_820_530_830] Help with Transmit Line

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-06-28 13:39:52 UTC
From: Bill
Topic: 1974 Message: 1981

As a follow up to my previous message, I replaced the Fix-Vox board with a replacement
Fix-Vox board and the rig now works 100%. Apparently something else is defective on
the board. I will troubleshoot it at a later date. Please see my prior msg about the problem
I experienced attached below.

Since the failure of (2) (same) boards on 2 different rigs using the same VFO, I suspected
a problem with the VFO because the rigs worked fine prior to connecting to the VFO.
I traced the line associated with the Fix-Vox board identified as RL. This line goes to the
relay coil in the rig, the Fix Vox board, and a few other places in the rig.

The RL line goes directly to the collector of Q9 on the Fix-Vox board. This
line also goes to pin 5 on the VFO connector on the back of the TS-820s. Following the
schematic into the VFO, pin 5 is connected to one side of the VFO relay coil, a diode and
a capacitor. The other side of the VFO relay coil is connected to pin 3 on the VFO connector.
Following pin 3 back to the TS-820s VFO connector this line is connected directly to ground.
Therefore, we have one side of the relay coil grounded and the other side activated by a + signal
on pin 5. I hope you have followed me this far.

Opening up the VFO, there is very little that could go wrong with it to damage external
equipment (the TS-820s). The only real thing that could do such damage would be either
a dead short or a defective component. As stated before, pin 5 of the VFO goes to 3 components
the relay coil, a diode and a capacitor. Testing these components revealed a failed diode across
the relay coil.

The failed diode put a dead short on the RL line. Therefore when I transmitted, Q9 collector was
connected directly to ground through the shorted diode. Hence, burned up parts on the Fix-Vox
board. Just thought you might want to know what I found.

Subject: [TS-520_820_530_830] Help with Transmit Line

Apparently my VFO-820, has some kind of problem and has damaged (2) rigs before I knew what was going on. On both rigs, the FIX-VOX board lost components. Q9, D17 and R31 shorted and/or burned. R31 actually roasted, Q9 shorted and D17 opened. With these components damaged, I lost the ability to transmit. Receiving is fine. The damaged circuit seems to be a switch for 14vdc to the relay coil (RL). Diode D17 seems to be protection for back EMF from the relay coil.

I replaced all (3) components as follows:

Q9 with a suitable NTE device
D17 a 1N60 diode with a 1N34 device
R31 with a like value resistor.

Turned the rig on and I still have no transmit either with the mic or the Send/Receive switch on the front panel. I measured the relay coil and get somewhere around 380 ohms so I know the relay coil is OK, right? Can the 1N60 be replaced with a 1N34? I checked the specs on both devices and it seems the 1N34 can be used in this circuit.

Since I have spare components, I will replace the FIX-VOX board with another known working unit to see if that solves the problem. If not, does anyone have any ideas where else to look? I suspect since Q9 is a simple switch, there may be more damage on the board.

As a side, in the schematic of the radio there is a device called "CH" with "In" and "Out" labels? It is located on the schematic above and to the right of the right of the relay board. It seems to be a coil of some type but I am note sure and seems to be associated with the 14vdc bus. Anyone know what this device is or where it is in the radio.

1982. Storing a radio

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-06-29 10:16:12 UTC
From: ka9vaa
Topic: 1982 Message: 1982

I have a 520se-530-820-830 and a 930. I just don't have enough room on my desk. I would like to store a couple away. Anyone have any suggestion on how to safely do this? I thought I would clean all switches - lube the fans and vfo shafts, wrap in plastic and put in boxes. Does this sound ok? I don't want to find in a year nothing works.

Thank you

1983. Donner's Digital Interface 830/

Hi Guys,

Years ago I replaced the lollipop D-104 mic element with a Heil HC-4 element. I also installed a impedance-matching transformer as Bill suggests and had terrible results. Finally, after much screwing around with it, I tried it without the transformer and it worked great!!! Still run that same mike with my TS-520.

I was just checking into doing exactly that, eg:
dropping the HC-4 into a D(as in DEAD)-104. Heil no
longer sells the element seperately. I haven't asked
him why.

BTW, sorry to dupe if this info is already out. I'm
1.63 weeks behind on my e-mails, as usual.

1988. TS 820 TX to RX Response Problem Update

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-07-02 10:25:14 UTC
From: Donald Bryant
Topic: 1988 Message: 1988

Hi Group!

Update on the TX- RX response time issue. I found the Frequency Counter(DG-1) cable was in close proximity with the IF board on top of the chassis. I moved it to below the chassis and ty rapped it 1/2 away for any other cable.

NOW FOR THE RESULTS!

On the 1st several keyups... The Receiver springs back to life with reduced volume and the S meter is pinned to the right corner. Then it will pop in about a 1/2 second later. No words chopped not just low volume. Its like the RF gain is turned down and the gain finally pops in.... ONLY ON SLOW AGC . Normal Behavior in the OFF position and have not tryed the fast position for any length of time yet. Checked contacts on both relays and they looked good. lightly rubbed them to make sure they did not have residue.

Anything to check.. I was sucessfull in download a service manual and have aligned the 3.3V ,9v and RIT and the unit seems to receiver clearer. One ham say on a local repeater to let the radio warmup for several hours to see if the problem disappears. Hope to do that this weekend.

Happy 4th of July All!

The problem is in the relays.......the TS-820 has two of them. They need to be cleaned with something like deoxit. I cleaned mine once but they need it again. The contacts can look good and still be oxidized. This seems to be a fairly comman problem with the relays. Good luck.

Thank You and I have concluded you and another gentlemans response is this problem is 100% correct. I noticed after I put the rear relay back in and screwed it down the screw must have touched a wire in the PA compartment as I had a high voltage pop until I moved the wire around.

Again Thanks for your reponse!

Update

Donald

The problem is in the relays.......the TS-820 has two of them. They
need to be cleaned with something like deoxit. I cleaned mine once
but they need it again. The contacts can look good and still be
oxidized. This seems to be a fairly comman problem with the relays.
Good luck.

Then it will pop in about a 1/2 second later. No words chopped not
just low volume. Its like the RF gain is turned down and the gain
finally pops in.... ONLY ON SLOW AGC . Normal Behavior in the OFF
position and have not tryed the fast position for any length of time
yet. Checked contacts on both relays and they looked good. lightly
rubbed them to make sure they did not have residue.

1992. Finals will not neutralize

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-07-03 19:39:57 UTC
From: irjack2004
Topic: 1992 Message: 1992

Hi Folks,

I am Jack Sumner, KC5DHD. I have owned a TS-520 since the mid 1970's, and it has sat in its carton for about the last 20 years. Getting it out a couple of years ago, I found everything fine except that the tubes had gassed. I replced the tubes with new ones, a matched pair of 6146B's and a 6BY12. Everything is fine now, except that I cannot get the finals to neutralize!

What I have done so far is this: I am using a Micronta (Radioshack) FETVM equipped with an RF probe that I built from a design in the ARRL Handbook. Following the instructions in the Kenwood owner's manual, I adjusted the neutralizaing capacitor until there is no deflection on the FETVM. The plate current dip and RF output peak are almost on top of each other, but the finals still self-oscillate. I have minimized the rate of self-oscillation, as evidenced by the time it takes for the plate idling current to creep up noticably, but nothing I have tried has eliminated it altogether.

I will welcome any recommendations you have.

1993. Re: Storing a radio

Topic: 1982 Message: 1993

I really think Bill's idea of loaning it to a friend is the best suggesstion, but I have to point out that I stored a TS-520 in its original carton for about 20 years and it kept just fine, even through several moves -- only deterioration was the tubes, which I expected after 20 years.

1995. 2nd Relay Location

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-07-03 20:38:45 UTC
From: Donald Bryant
Topic: 1988 Message: 1995

The 1st one is under the middle of the radio with not metal cover. The 2nd and hidden one is directly under the PA assembly on the bottom of the chassis with a small metal cover over it. Its is against the BACK of the Radio and takes 2 screws to remove the cover to expose the relay.

Bill <k2wh@...> wrote:(2) Relays???????? Please enlighten me because I know of only (1) relay in the 820.

I just got a 820s brand new after 25 years and it is perfect. Kept in the box all
this time and no deterioration detected. Even the screws are shiny.

Keep any rig in a cool DRY place. Add desiccant bags to the storage box.

Vacum pack the whole thing! No freeze dry it then vacum pack. The send it on a specialy calculated space trajectory (according to Einstein ??) that would make it age slower than us on earth. You'd have a newer than mint!! Would make the ebay cronies flip out!! They could ask more than the 'mint' price! (which sometimes surpasses the real value).

I know, I know I'm taking up bandwidth!! But I am /ham/ !

1999. Re: [TS-520_820_530_830] Re: Storing a radio..... Maximum humidity?

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-07-03 21:40:38 UTC
From: donii@sympatico.ca
Topic: 1982 Message: 1999

Gentlemen
If the ideal humidity level for storing a radio is 0%, what would be the most tolerable % for my transceivers that I have in my shack/basement that I try to keep around 45% to 50% humidity. My dehumidifier will have troblr keeping it any lower unless I kick up the room temp.I collect boatanchors and many of their blemishses on the innards are surface deterioration of the metal chassis and various alumimium housings. Many of my boatanchors have had it bad with water running down the coax into the transceiver. Just this is a good argument for having a matchbox(antenna tuner). Apparently Brasso wil fix things up...I'll try it and get back to the group.

2000. Re: [TS-520_820_530_830] Finals will not neutralize

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-07-04 13:01:02 UTC
From: Bill K0ZL
Topic: 1992 Message: 2000

When this occurs, reach in there and remove the driver
tube, see what happens.

You can take the driver shield off ahead of time to
make the task easier.

Usually it's the driver that's oscillating.

2001. 830s Outputs

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-07-04 19:35:36 UTC
From: R. Braddock
Topic: 2001 Message: 2001

Hi guys,
I decided to reapproach my old 830 output problem today and it is back on the bench. I have pretty much replaced all the resistors in the PA section and checked my connections against the schematic. I think that this particular 830 was hacked(or attempted) to do CB. A while back, I posted that the outputs begin to glow orange soon after the heater and the SG switch is turned on. So, I bought a NOS set of 6146Bs and proceeded to start troubleshooting. Now I'm showing 900V on HV and the plates are glowing a dull orange. The IP is a little over 200ma. Is it normal for the tubes to be dull orange? Would not being neutralized properly do this? What, specifically, do I need to check? I have several more modern radios, but I really like this this old 830 and the receiver is great.

Richard Braddock KI4BFC

2002. Re: [TS-520_820_530_830] 830s Outputs

Looks like you have lost your grid bias.

Have you checked the bias adjustment? It's a pot on
the back of the rig, near the bottom rail. You should
be able to adjust Ip down to zero in USB or LSB
transmit mode.

I just checked the bias adjustment and it does nothing. The IP remains at about 250ma when in transmit on tune mode. I measured about -78VDC on the bias pot, though. I did go ahead and spray Deoxit in it to see if it would help and it did not. Next step?

-78 volts should cut off all tube plate current.

Tube idle current should be checked in LSB or USB mode
with no modulation; not TUNE mode.

If excessive current persists in LSB or USB mode with
the pot all the way CCW as you face the rear panel,
you have then lost the connection between the pot
wiper and the tube grids, somehow.

Typically, the 6146 will cut completely off at about
-65 volts.

I forgot to mention that I had the 830 on the variac at about 90VAC when I did this, so the reading would be a little low I guess. I had replaced the voltage regulator board a while back, so I will double check all of the connections to it.

2006. TS-530s - Cause of high voltage like popping sound?

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-07-06 01:23:19 UTC
From: spoolmak76
Topic: 2006 Message: 2006

I've got a TS-530s that once in a while (more often lately) emits a loud SNAP shortly after turning on the radio (in receive). I've looked inside the case and there is no apparent cause for the noise (no dead capacitors, no soot traces, no dust, no spiders, etc). Any idea what might be the cause?

Thanks!

Look for dirt or dust around the HV compartment, xfmr windings and the
PA area.
Get some high pressure dry air and blow the rig out. Look for opposing
metal or
circuits that are too close to one another. Since the HV is only about
800 vdc and
not alot of current, it may not be obvious where the arcing is taking
place.
Close examination (with power off) may be necessary.

My guess is that a HV capacitor is arcing internally. I have an Amp Supply LA-1000 and it would occasionally make that dreaded noise. It did that for probably a year until the cap permanently shorted and bulged.
Others may have other opinions...

Funny you all mention that I had the popping noise for about a week until the until popped and quit transmitting TODAYon my TS-820 . I found a wire burned open and turns missing on the small RF choke about 1/8 inch from the metal ring of the rear 6146b. I measured 925V (appx.) on the supply side of the choke and zero on the plate side. It was a 3uh choke and I did not have one. I cheated - I tore up an old ac adapter and noticed the wire was a tad larger in gauge. I wound 40 turns vs 30 turns as I did not feel the value of the choke would be that critical. I carefully spaced it as far as I could from the tube base. I have only transmitted into the dummy load but it appears to be fine now as It occured today 7/5/04....No I did not get to work the 10 meter opening.. Its Allstar baseball season in South Carolina!

2011. VFO-520 Use with a Ts-520S

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-07-06 11:53:58 UTC
From: Charles D. Feigley Sr
Topic: 2011 Message: 2011

Hello All,
I was wondering if it is possible to use the VFO-520 with
my TS-520S. I would like to have a VFO-520S but a VFO-520 is for
sale by a local ham,and I thought I would use it if possible.
Thank You in advance for your help.

Be sure to check the top of the plate choke; that wire
is really small and can break loose, then arc over
where the end is close to the top of the coil form.
Have seen this twice.

To fix, just unwind one turn of wire, strip the enamel
off the end and re-solder to the top lug.

Air compressors are under $100.00, every ham should
have one with a stinger nozzle to blow the rigs out
once a year.

2014. 830s Outputs

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-07-06 14:32:53 UTC
From: R. Braddock
Topic: 2001 Message: 2014

Well, I am kind of at a loss. I removed the output tubes and switched the SG and heater to ON. I'm not sure what to look for. I measured the bias from the pot and it does adjust. It is in the 80VDC range in receive and in the 60VDC in transmit. I have been trying to find this somewhere on the PA board, but I cannot. Can someone tell me what voltages to what pins I should find on the PA board? Apparently, Bill is correct, I am not getting a bias to the PA. But, I'm not sure where it should be coming from and where it is suppose to connect. Thanks for the help.

This is also an interesting topic, since I had to totally rebuild the PA cage(everything appeared burnt up!). The plate choke in mine appears to have had excessive heat and the enamel is charred. However, when I pulled everything apart, I measure continuity on this choke and I still have 900V at the top. Should this thing be rewound? If so, how many turns of what? Thanks.

KI4BFC

NO !!!
All hams should have some Can Air to blow their rigs out. Compressed air
from an air compressor can contain water and oil. You do not want either
in your rig.

In the meantime before Bill gets to look at his schematic, can't you find a diagram of the 6146 on the internet and see which pins are which? That is what I did with the 6KD6s in my old FTdx-570.
73 & good luck,

Yes... I have used my compressor for years with no
problem whatsoever... the air coming out is clean.

that canned air stuff can get expensive by the time
you do your rig, the computer, the monitor, the coils
in the fridge, and the grankids soccer ball..

6146B, from RF parts or a seller on Ebay that does a
lot of tubes and has good feedback rating. Should be
from 65 to 95, depending on source.

Yes, you may have to neutralize the PA. Fun to learn
but a bit dangerous. Hey you did firecrackers for the
Canada Day, no?

I agree that one needs to stick to the same
manufacturer on the tubes; but matched pairs are not
that much more expensive. I think sometimes they are
easier to neutralize. I know, they are in parallel and
it shouldn't matter. Just an observation.

From: james27613@att.net
Topic: 2028 Message: 2028

Hi Walt,

Yes shop air can have trace oil and moisture from the older units
that do not use an external receiver/dryer ($ 20 or less) to protect the
tools and other equipment.

The newer oil less types should also use the receiver/dryer to trap
the water vapors from the compression cycles.

If a compressor in not available, just user the shop vac in blow cycle
or borrow the xyl blow dryer and use it without heat !

Subject: RE: TS-530s - Cause of high voltage like popping sound?

NO !!!
All hams should have some Can Air to blow their rigs out. Compressed air
from an air compressor can contain water and oil. You do not want either
in your rig.

Walt

Yes, Charlie, the VFO-520 is designed to work with the TS-520s. In fact, it is a very nice combination. Be sure you get the connecting cable and the manual.

Charlie,
I'm sure you can, it was made for that purpose. I have a VFO 820 that I used for my 520s. I bought mine off ebay fairly reasonable, and it works great. Make sure it includes the cable, or you will have to make one. As far as I know, nobody sells the cable, but you can still buy the connectors and solder your own. It's a simple straight through (pin 1 to pin 1, pin 2 to pin 2, etc.) connection. I used a short section of CAT5E network cable to make mine, along with some heatshrink tubing for strain relief at each end.

Hope this helps.

HOwday Kerrod,

Any tuner made for ham radio will work with your 530.

YOu need to decide if you want an auto tuner, or a
manual one.

Hint, if buying MFJ, buy the largest tuner you can
afford. The "100w" tuners cannot really handle 100
watts... I figure on derating MFJ products by at least
50 percent.

2045. RE: [TS-520_820_530_830] antenna tuners

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-07-08 13:22:28 UTC
From: Ron Kienzle
Topic: 2042 Message: 2045

Wow, Kerrod, you've probably just asked a question whose answer would fill a book! In short, it doesn't matter to the 530 what kind of antenna tuner you get -- what does matter is (a) your budget; (b) your interest in knob twiddling; and, (c) your antenna system.

Some antenna tuners cost over $1,000 but others as little as $35 used. A good price range for a decent manual tuner is about $75 - $150. If you don't like turning knobs, the automotic antenna tuner that matches your rig will run up to $300 on eBay.

Since you have tube finals, you might think about getting a tuner with a built in dummy load. Tune your 530 into the dummy load first then tune the tuner to match your antenna system.

If you have a wire antenna fed with ladder line or a single wire drop, you'll need a tuner with that capability, too. If your antenna is short, you need a fairly hefty tuner with lots of inductance range. MFJ makes some good roller inductor tuners and you can pick them up on eBay or eHam for around $200.

Fully automatic remote tuners like SGC get pretty expensive but they sure are nice.

Well, this might have been very confusing and didn't answer your question -- but, as you can see, it isn't a simple issue.

Good luck and 73,

--Ron (KZ7P)

You may want to consider the ICOM AH-4 autotuner. This tuner goes for about $ 250 US and, will tune just about any type of antenna. I have (2) one in the mobile and one at the base of a vertical. It works wonderful.

Hi Guys...you are probabbly refering to me....do a search on this group for "WARC" and you should get the history of the info.

I made a CD copy of the article and others of interest, for my own personal archive. Unfortunatly, I didnt have the capability to make them PDF Files and so sent them to another ham to encode them in PDF. I hope I still have them around, as I lost an archieve CD to damage latley.

You may still find them, however, on the HAMFTP file archive. (get more info from Bill or search Yahoo Groups). Although technically, I did not authorize their public distribution, they may still be found for "loan" at that site, in the Kenwood download section.

OK guys and gals; since we are on the subject (antenna tuners), why do antenna tuners as a rule will handle at the most 300w. What about the guy who wants the complete set-up of his station (i.e. 830s, vfo230, sp230, sm220, mc50, at230, and tl922). The at 230 is useless when used with the amp as the tuner is only rated at 300w. I'm an extra (licensed since 1971, but have yet to figure this one out. Am I missing something?

The Kenwood AT-130 matches the looks of the 530/830
and is a good manual tuner. You will need to keep eye
on swap shops and ebay; talk 'em into selling and
shipping to you there, and you will have a good
looking box.

Why do you need a tuner? What antenna are you going to
run with the rig?

2051. Re: [TS-520_820_530_830] antenna tuners

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-07-09 12:11:14 UTC
From: Bill K0ZL
Topic: 2042 Message: 2051

The KW (and up) tuners are more expensive, and use larger (more arc-proof) components. Actually, most of the tuners rated at 300 watts, may survive 300W going into a dummy load (resistive 52 ohms) but are really only 100W tuners. Some of these can't even handle 100W into some loads! You get what you pay for.

I have heard very good reports about the SGC and Icom AH4 autotuners, and have yet to see any damaged from high SWR, although they are twin T type tuners which tend to carry huge circulating currents when working into reactive loads, particularly on 10-12 meters.

I think a large roller inductor with two vacuum variable caps, in a traditional PI network, would be unbeatable.

Ah.. and here's the rub... your hybrid (tube output) rigs and tube linears can usually withstand up to 3:1 swr without problems.... if you can stand seeing your reflected meter kicking up so high that is! Just make sure you are on or close to your plate dip; and adjust the loading for about ten percent dip. Then tweak both for maximum forward power output in TUNE mode. If arcing occurs in the amp, advance the LOAD control a bit and re-dip the plate. The amp will let you know in short order if you are asking too much of it.

Hello Bill.
At present I use an 80 di-pole angled down slightly at both ends, and in between two high-set houses. It also passes about 1.5 metres above the metal roof for about half the length on both sides of the centre pole which is about 8 metres high. The feed line is RG213 coax. I am limited in what I put up as I live in a rented house and can not put too much up in the way of masts/poles.

After reading Ron (kz7p)'s comment below, I have just purchased (today) a Yaesu FC700. This will be a start for me at any rate, so I'll see how that goes for a while and until I get some more dollars together.

73 for now, and thanks again. Kerrod.

2053. re: antenna tuners (kind of...)

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-07-10 14:57:35 UTC
From: Jeff, Julie, Annabelle, and Nicholas
Topic: 2053 Message: 2053

While we're on the subject, I'm considering making a dipole for 40m to use with my 520SE. If it's cut for 40m and I use it for 40m only, I don't really need a tuner for it, do I?

2054. Re: [TS-520_820_530_830] re: antenna tuners (kind of...)

Yahoo group: TS-520_820_530_830 (2001 — 2004)

Topic: 2053 Message: 2054

No. 31' 6" for fone, then trim for lowest SWR at 7.225
Mhz, should cover most of the band if you like fone.
For CW go 32' and trim.

That is length from center to end, each side.

That's exactly right. Using resonant antennas, many hams have never even owned a tuner.

I seldom use mine.

While a tuner is not a necessity, the lack of a tuner robs an amateur from the full use of a perfectly good multiband antenna. If you plan to operate (1) band and (1) band only, then yes by all means, cut a resonant dipole and have at it. This is a myopic view of the amateur world in my opinion.

If you ever get a desire to operate other bands, you will be out of luck. Every amateur should own at least one tuner either internal to the rig or my favorite, external to the rig. We amateurs have frequency BANDS, not single, specific frequencies and we want to operate anywhere within those bands - a tuner will allow you to do this with great efficiency from band edge to band edge.

Don't sell your antenna short (pun intended). I wire dipole sized for the lowest operating frequency you intend to use, is one of the simplest and most efficient types of antennas you can own that will (with your tuner) operate very effectively on all other bands even into VHF regions. Get a tuner, learn how to use it and you will be a much happier and versatile ham radio operator.

Or, put up a flock of resonant antennas. Multi-band beams, verticals, resonant wires. They don't need tuners. I agree, however, that on the lower frequencies, narrow bandwidth can limit one's capabilities.

On 80 and 40 I have opted for what seems to be the
most efficient antenna for my lot; a trapped, tuned
dipole. I use the Unadilla traps on 40m, and tune the
antenna for the phone portions of the band so I don't
need a tuner. The amp and the rig are both happy; I
hope the Valiant will be when I bring it online and I
can use a low-pass filter without worrying.

For excursions to CW I can still use the tube rigs as
they tolerate the SWR and the 850 AT unit takes care
of the rest.

All,

Thanks for your input regarding my 40m antenna question. I''ve been operating 20, 15, and 10 with an MFJ Magnetic Loop for 10-30 MHz. I really want to get into 40m, so I just need the one dipole to cover that band, as the others I like are covered by the loop. Thanks again for your hints. FYI - HOA restrictions forced me to get the MFJ loop, but I've had no problems with it. I recommend it.

Jeff

I just receive another VFO-820. Comparing this VFO-820 to my other VFO-820,
revealed different style main tuning knobs. One of them has the extended "Stud" or
protrusion for speed tuning and the other does not.

Is this just a manufacturing change or did these VFO's go to different types or
manufacturing runs of 820's?

Bill,

Were you ever able to find voltages that I should be looking for in reference to the glowing output tubes? The 830 is still on the bench, but I haven't really done anything else with it. Just to recap, I was able to verify that bias was at the pot and it does adjust. I just cannot find it on the PA board.

Thanks

Richard AE4BP(formerly KI4BFC)

I purchased a clean TS-520s. Can some of you guys advise me the best things to do to check this unit out? I had heard that there are capacitors in the high voltage area that are typically suspect in these older units?

I was told this radio was working about 1 1/2 years ago. Since then it has been on the shelf while I worked toward my ticket. I am now a freashly minted general.... and want to get it running without blowing something out.

John, plug it in and crank it up!

Warm the filaments up for a couple of hours prior to
trying to transmit; this will help drive any air
molecules in the tubes onto the "getter", a device
inside the tube that is there for that purpose.

You can hang your 40M dipole while the radio is
warming up!

73,

Bill

Richard,
Sorry, I was quite busy restoring a Johnson Valiant...
that one is a pay job so I was quite pressed to get it
done!

I will look this up for you tonight.

I am sure that there is a low-value resistor somewhere
or perhaps (less likely) a choke in the line between
the bias supply pot and the tubes that has opened.

Another possibility is a stuck relay contact on the
T/R relay.

Operating on 160M adds another dimension of challenge for antenna tuners. Most of the high power tuners just can't handle any power into many 160M antennas, like a long wire, inverted L, tee or even dipoles - all cut for the 160 M band.

They start to arc and spit at about 200 Watts - and/or won't tune some or all of the band.

Only tuner that I've found to be satisfactory on 160M - and it will handle 1500 W PEP - is the Ameritron ATR-30. You pay for what you get!

Absolutely correct. The only tuner I found that will not arc over on
160
is the ATR-30. Any other so called 3kw or 5kw tuner arced over event
into
a resonant antenna on 160. The ATR-30 took 2kw of input power without a
hiccup. It is the best (and biggest) tuner I have ever used.

2069. Intermittant transmission on SSB with TS-830S

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-07-11 19:18:31 UTC
From: rdl014
Topic: 2069 Message: 2069

On one of my TS-830S Kenwood's everything appears to be working fine and when I try to transmit the next time, I can hear the relay, but I get no output. I am using a MC-50 mic. I can continue to press and release the PTT bar and I can hear the relay and then after a few tries, it again transmits. It seems to do this after the rig has been on a while as I do not have this problem when I first start. Do I need to clean the relay contacts and if so, exactly where are they? I do get full out put of over 100 watts so I do not feel it is the transmit section. TNX and 73, Ray AK4RL

John;
If the rig has been setting for awhile it is possible the cap's are a little dry and could cause you some headaches when fired up. There is a divice out there that allows you to feed a low voltage into the rig and gradually bring the caps up to full operating power. I don't remember the name of the silly thing, but I used one on my SB 200 amp which had been sitting about two years with no activity. It took about 4-5 hours before I was up to full power (110 volts), but the filter caps are expensive. See if you can find one in your local club. Some "Elmer" may have one and be glad to loan it to you and maybe even come over and help you. Welcome to HF !

Subject: [TS-520_820_530_830] ts-520s

I purchased a clean TS-520s. Can some of you guys advise me the best things to do to check this unit out? I had heard that there are capacitors in the high voltage area that are typically suspect in these older units?

I was told this radio was working about 1 1/2 years ago. Since then it has been on the shelf while I worked toward my ticket. I am now a freashly minted general.... and want to get it running without blowing something out.

Carefully rock the bandswitch just a bit next time it
cuts out, see if the tx power comes back.

2072. Re: Finals will not neutralize

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-07-11 23:59:04 UTC
From: irjack2004
Topic: 1992 Message: 2072

OK, here's where we are so far:

I tried pulling out the driver tube, and the self-oscillation continued. Then, following a suggestion by a friend, I took the plate cap off of one of the finals. The remaining tube was a little difficult to tune up -- had to turn the Load control fully CCW, but it neutralized with no trouble. It tuned a little easier then, and I idled it for about 20 minutes with no sign of any oscillation. Just to satisfy my curiosity, then, I switched tubes. The other one gave less trouble with its initial tune up, but I had to back the Bias off to get the correct idling current (30 ma. for one tube). This tube neutralized just fine and it did not oscillate either. They just don't seem to want to work together. Any ideas other than operating at half power? By the way, how efficient is that final? About what should I estimate the power output to be?

If you haven't found it yet, I have hard copy of the TS-820 conversion article.
If someone has a scanner I can send it to you to scan and upload the file.

Inrad made a WARC kit to get the 3 'new' WARC bands with the FT-101.
Does anyone have knowledge of some thing similar for the
TS-520_820_530_830 line.? I think it can be done with the TS-530,830 but
I have an 820.....
Has anyone ever added bands to the 520/820?

Hey Peter,
There is an ARRL article that tells of how to add the WARC bands to the 820. Maybe someone on the reflector has a copy they can upload? I have an 820 also and was looking for this article right up untill I found a great deal on a 930SAT.

From: Mike kd8q
Subject: Re: Warc bands for TS-520_820_530_830 ??

Hey Peter,
To follow up. The articles were in Feb 1983, Nov 1983 and Jan 1984 QST. The first deals with the Mods. The second with feedback on the first and the Jan 1984 article says technical correspondence! Hope this helps

Mike kd8q

I don't approve of political jokes. I've seen too many of them get elected.

With a good set of tubes you should be seeing from 240
to 280 ma for 100-125 watts of carrier output.

Do the tube manuf's match?

You can buy a re-tube set (driver and two finals) off
ebay for about $65 or 70 bux... some good sellers
there.

Save the old tubes, they may work fine in another rig.

Thanks for the info, Bill.

The tube manuf's do match. I bought them as a matched pair from RFParts. I do not recognize the logo on them, though -- a great big capital G with a squiggly line running through it. Does that sound like a logo that you are familiar with?

That would be the new Russian company spun off from
Svetlana, they couldn't use the Svetlana logo. I
think.

Anyway if you can find another pair of tubes to try,
that would prove that it's an incompatible tube. It
does happen once in a while, I just hate for it to be
on our nickle, hi!

2077. Re: Finals will not neutralize Just how good are Svetlana and Russian tubes ??

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-07-12 21:30:49 UTC
From: donii@sympatico.ca
Topic: 2077 Message: 2077

The subject line says it all. I've read a few posts that cite problems with stability and parasetics pronlems with foreign tubes.. I have a FL 2000 that I would like to retube but I'm afraid..... I sure would not want to 'test' these tubes in my beloved TS-820....this my 'Baby' among my 7 boatanchors!
Anybody have firsthand experience with these tubes?
What about the Chinese 6146's...I've heard things not soo good.
I think that I'll go the 6883 route . I don't mind modifying the transceiver a bit.....after all I bought it to transmit not to sit in a 'Collection' . My wife uses her antique furniture in the house ....I use my boatanchors or they won't stay here. I'm not running a museum. Those electron have to move in my shack!

Zero difference. Don't ever spend "extra" money for one. Check the
Kenwood archives on QSL.net. We beat this one to death several times.

Other than the "Gold" below the VFO knob, there is no difference. In fact there are more of the gold series in the world than the TS 830S. Makes you wonder why the prices for the gold series is higher on the for sale boards. Must be the magic of the word. GOLD.

Hi,

Consider GE USA made tubes before you try 6883 tubes,

http://www.surplussales.com/Tubes-Sock-Acc/TubeSpecials.html

He ships worldwide.

James its a question of economics..... I'm sure that Surplus sales tubes are good but shipped and in Can dollars (over $120) those tubes will cost more than the TS 820s they will go into. I can get 6883's here for much less and they are the same tube with only heater voltages being 12v. Actaully the would have to be 6883B's to be exact if I want full power ouput.
But I really would rather have U.S. made 6146B's in there.

Topic: 2087 Message: 2087

Typical Qso's I seem to be off very slightly. I mean very slightly. RIT can more than take care of the issue, we are talking .1 to .2 on the digital meter at worst case. I notice just about that much fluctuation when I key up the mic or activate the vox on the digital readout.

Suggestions? or just leave a rig that works well otherwise alone?

Easy fix or bad fix?

2088. Re: [TS-520_820_530_830] Small Freq issue TS-820

Ignoring your readout... when you get someone tuned in
for most natural sound, are they complaining that you
are off?

This is a different problem than the display being off
from net announced frequency for instance.

One is a "convergence" issue; the other is simple
calibration of the counter.

From: Greg
Topic: 2086 Message: 2089

Once again, in case you missed it in my last post; the full files for the TS-820s WARC mod are on the RUBE FTP site. You MUST join the Yahoo HAMFTP group to get info on how to get on to the RUBE file server. It is very easy, but you have to read the files section on how to do it.

If you dont want to go through the Yahoo HAMFTP group, to "borrow" my WARC mod copy, then I cant send them to you by mail..... but it will take a long time for me to get to it. And you will have to "contribute" for the re-scanning and PDF file work I will have to re-do.

Therefore, I recommend joining the yahoo HAMFTP group if possible...well worth it! I WILL NOT include the direct link to the download site here, as you should become a member first. (if Bill wishes to post it in a new posting, that is up to him). I checked and the WARC mod for the TS820-s is still there under the Kenwood section! (As well as some other tech notes)

2090. New TS820 Owner

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-07-15 03:09:47 UTC
From: KABOONA
Topic: 2090 Message: 2090

Hello, I just picked up a nice looking TS-820. I have not yet been able to test it in transmit mode since I only have a tech ticket but have been having a lot of fun listening with it. It seems to be a superb receiver. I only have one of those window HF antennas and so far I am listening to more stuff than with my FT-897. I do have a question tough, I understand that this radio has the capability of having crystals added. Is it possible to add crystals for MARS frequencies and use those in the AUX channel?

Any help is appreciated.

regards

Jim

2091. TS-520S New Ham, New owner. . .

Topic: 2091 Message: 2091

Hi all,
Fairly new ham here, still a tech but have passed my written for General, now learning the code and hope to pass it soon. In anticipation of that, I purchased a TS-520S, with the DG5 digital display, and Kenwood Desk mic. Also got the owners manual, and service manual. I did have to install a set of finals as the output was only about 10 - 20 watts.Also installed a new driver since I was changing the finals. Had no problems doing that, and with a General ham here,got them neutralized and it seems to tune up fine.
Any quirks about this rig I should know about ? I am using it with a G5RV, recieve is excellent on all bands so far. Should I use an antenna tuner or is it not needed.
Thanks, 73 !
Dave, KC8YOX

Yes, you can use the FIX channels for Mars operation.

Not sure if the book gives the formula or not but you
should be able to call International Crystal and they
can make them for you.

Why not just put the mod in the 897 and use it for
Mars?

Hi Dave,

Nope, you are ready to go.

The rig will work fine with the G5rv, just tune for max RF out. If the SWR is too high on any band, the rig will let you know; either the LOAD control will be at one end or the other and you won't be able to get max output (always check plate dip in this case; if it's 10 to 20 percent dip in current at resonance, you can still operate the rig) or you will hear some arcing as you tune up.

You will not need a tuner unless this happens.

If you can lean on your General friend, tell him to come see me! I need stuff done!

Seriously, if he has an SWR meter have him bring it over and put it in line with your antenna. While I agree with Bill on the antenna, I have a G5RV, they are not all built the same and the physical placement affects the swr as well. Mine does not resonate anywhere under 2:1 without a tuner.

The G5RV is a 3/2 wave antenna for 20m and should resonate on 20m without a problem With a tuner it should work on all bands.
I have always questioned why a lot of hams use this antenna? Is it because it's short? (102 ft) Because you use coax to get to the shack?
Personally I would recommend a 135 ft dipole or longer if you got the room feed it with 450 ohm twin lead and a tuner. It'll play anywhere.
Norm, W3IZ

Peter, I could not agree with you more ☐ those rigs were made to be used, not looked at. My TS-520 is `my baby' too. It was my first `adult' rig after I got my Advanced ticket back around 1975 (I had been using an HW-16 before then). Before I put it away and became inactive for about 20 years, my TS-520 gave me several years of very good hamming experience.

Bill, and all, thanks for your help. I'm only getting about 10 watts out of either one of my finals so I will be re-tubing my TS-520 as soon as I can. Those 6146B's are marked `Made in China.' However, I have to confess that I may have trashed those tubes myself. When I first got them a couple or three years ago, I was so eager to get back on the air that I did not take the time to do things right. Instead of getting hold of an RF volt meter and following the procedure I tried to guess at neutralizing the finals -- tweaking the neutralizing capacitor until I got the Output Power peak together with the Plate Current dip. Instead of a proper antenna I just threw about 50 feet of wire into a tree and tried to end-feed it through a Versa Tuner II against a ground that consisted of a wire connected to my backyard spigot. (I knew better, I don't know what got into me!) After blowing two fuses I realized that the finals were self-oscillating and that convinced me to shut the operation down and do my homework. So I guess the final line on this episode will be "Lesson learned ☐ you can't cut corners!"

73,

wrote:HI,
Thanks for your reply.
We did check the swr with a meter, and it was as follows (all in
about the center of each band)
160m 2:1
80m 2:1
40m 1.5:1
20m 1.3:1
15m 1.2:1
10m 1.1:1
did not experience any arcing, but don't want to chance it either.
The rig showed outputs at the antenna connector into a dummy load, of
between 80 and 200 watts depending on which band we were on. Does
that sound right ?
Also... someone else told me that to run AM you can insert some
carrier into the SSB signal for a sort of "pseudo AM " though I
question this. Seems like if this rig ran AM it would say so in the
manual , and have a place to choose this mode so don't think I will
try that.

Hi ,
First, Thank you for your reply ! It is appreciated !
We did check the swr, it ran between 1.1:1 and 2.2:1 depending on
which band we used.
He thought this would be okay, but now I am wondering. Perhaps I will
try a tuner. I know the lower the swr the better for the rig and I
hope to keep this one a long time.

Thanks for your message Bill. I would like to use the 897 in a more portable fashion. I already did the mod to it via software and can tune those frequencies but I would like to avoid the connecting and disconnecting. Iam so far loving the audion on this 820S so much that I would like to use it at home as my primary rig.

By the way, can I transmit using the fix channels?
Thanks again
Jim

It sounds like you are a very lucky person to have the influence of the person who is helping you out. Return the favor whenever possible, it will be appreciated. There are so many silent keys out there now, I always wished I could have returned some small favor that they never asked for..... There are so many that I still have the photo memory with a mic in their hand or their hand on the key that are not with us anymore.....and without them, I would never have had a license.....it is a great family!

What kind of meter are you using?

ON the rectifier unit, look for terminal marked C and
measure to ground. DC volts

Look for a terminal marked AC100

(to finish)

On the RECT unit measure terminal C to ground, DC
volts, should be about -110vdc

On the RECT unit measure AC100 terminal to ground,
should be about 100 VAC or so.

Tried 40/80 trap dipole with open wire line to shack;
too much RFI in and out of radios from computer,
broadband internet, 10/100 lan cables etc.

The G5rv in most cases can be tuned fine by tube
transmitters without a tuner. I will be putting one up
here for the AM station, using a Johnson Valiant.
Should not care about 2:1 or even 3:1.

Well 200 out is too high a reading.. they won't do
over 150 even with the high power mod (don't ask!)...

Don't trust your wattmeter if SWR is any higher than
1.5:1

Don't worry about the exact power output either, just
as long as you are making at least 100 on lower bands
and 80-90 on 10 meters, the rig and tubes are fine.

Good going on getting a good antenna up! You won't
need a tuner.

See you on the air!

73,

Bill K0ZL

Yes you can transmit on the fixed channels.

Remember, all the fix channel crystals do is take the
place of the VFO... If you can't get on a particular
band using the VFO, you can't do it with the fix
crystals, I don't believe.

So if you are looking for 4.5 mhz for Mars, you have
some more work to do.

For some of us, the reward is in heaven.

I would recommend spending the money on a CW keyer
rather than a tuner, if that is the only antenna you
are going to use.

Or a CW filter.

But that's just me.

Bill

2110. For trade

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-07-16 18:53:03 UTC
From: Charles D. Feigley Sr
Topic: 2110 Message: 2110

Hello,
I have the folowing I would like to trade:
1: Kenwood TS-520S transceiver.
2: Kenwood VFO-520S
3: Kenwood SP-520
4: Almost All Digital Electronics C-520 Digital Display
for the TS-520S. Reads to 5places past the dot.
Example 14.300.00 And shows what mode you are
in. Cost on this alone was $150.00
5: Shure 444 desk mic
6: 2 sets of matched 6146B finals NOS
7: 1 12BY7 driver NOS
8: 3 spare dial/s meter lamps
9: 11 sets of riser feet and screws
10: Autek Reasearch QF-1A SSB/AM/CW
audio filter
11: Various plugs, jacks, ect for the radio, vfo,and
speaker.
This is my present working station and everything
is working 100%.
Would like to trade for a Icom IC-718 with a hand mic
and power supply. Will consider trade for Icom IC-703
or SGC-2020 if I cannot find a sutable trade for a
718. I need to reduce the area my radio takes up on
my work bench.
Please reply offline.
Thank You,
Charlie W4CDF

If you want more info on the 718, I uploaded the manual to Rube a couple of days ago, but it is still in the upload section.

Does anyone know where I can get hold of the DG-1 display or a modern solution of building one. I am finding that the analogue dial is not accurate enough.
Please can anyone help me.
My QTH is the SW of the UK.
Cheers
Nigel

Ebay might net you one from time to time, or try
http://www.aade.com/
for one. He has both kits and assembled units for sale.

RigRunner 4-pin Conversion Kit
Unused West Mountain Radio 4-pin conversion kit. Includes instruction sheet with jumper settings for older radios. No need for it as my TS-520 died on me.

Cost to me was $26. I'll take $17 + shipping of your choice. PayPal preferred. It's cheaper than buying the connectors and doing it yourself.

If you don't get any trades, list that rig on eBay and you'll probably get
$500 or more for it.

Consider getting a Yaesu FT-897/FT-857 or Icom 756MkIIG. For a couple
hundred more than the 718, you get a great HF rig that can do 2M and 70cm
FM, SSB, and CW. It's a considerable performance gain for the relatively
small difference in price.

I was in the 718 camp until I realized how much money I'd save later by
getting an 897. It's a great radio, but for less than the cost of a dual
band FM mobile, you can get soooooooo much more.

The original tubes were excellent, keep these in the
rig as long as possible.

The replacement is 6146B, GE, Sylvania or other NOS US
brand. (NOS is "New Old Stock", sounds like oxymoron
or contradiction, all it means is unused tubes).

You don't need a matched pair but do get same
manufacturer when buying tubes. RF Parts, Surplus
Sales of Nebraska and reputable eBay sellers are great
sources. I have used all three.

Also pick up 2 or 3 12BY7 tubes; this is the driver
and you will run 1 or 2 of these for each set of
finals.

2124. Dead (?) TS-520

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-07-19 13:04:57 UTC
From: Norman Young
Topic: 2124 Message: 2124

Jason,

I don't know what you mean by your 520 "died", but the neat thing about these rigs is that they have multiple lives, and many of the causes of death are relatively easy to troubleshoot and fix. You might want to use the expertise of this groups to see if you can get it going again, even if only to sell it.

I am using my TS-520 to run PSK with an MFJ interface, not to mention as my primary (make that only) HF rig, although I can identify with the desire to upgrade. I woud also like to upgrade to a new HF rig, but that is going to have to wait for at least another two years when the kid gets out of grad school!

Even so, the TS 520 is not going to go away...

Norman

Subject: Finals clarification please.

I recently acquired a TS-820s. I understand that the finals are the
S1001A type. Are these the same as the 6146 type? If so, which
series (i.e A, B...)?
I would like to get a hold of some spares and would like to pick the
correct part.

Thanks in advance.
Regards, JIm

I have only one bone of contention, in that the author
does not mention that the B series works fine in all
JA equipment (Yaesu and Kenwood).\

Also I can't see how neutralization would change with
time, unless the tube elements sag or something.

I have had several 520-ish rigs come back to my shop
for warranty repairs, and have never noticed that the
neutralization had changed over time.

I've already contacted the group about what to do, but right now it's 98?F in my garage. There's nothing obviously burned up on any of the surface boards and I don't really need nor want a $200 project right now. I'm pretty close to listing it on eBay and hoping to get my money back to get it out of here. With all of the extras, I should be able to come close.

The FT-897 with AT-897 autotuner sitting next to it really doesn't help inspire me to work on it.

Hi group.
I just uploaded a couple of pix of my TS-830 line.

TS-830, SP-230, VFO-230, AT-230, SM-220

The two pix can be seen in the W3IZ photo album on the Yahoo page.

I am a newly licensed No-Code-Tech. Hoping to rectify that shortly by passing the General Exam with code or wait for FCC to eliminate code requirement all together. My equipment consists of a Kenwood TS-520 sans CW filter and matching speaker and mike. I am on the lookout for a VFO-520. I think I did see a VFO-820 <http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&rd=1&item=5711043982> on eBay, but don't have a clue if that will work with the older TS-520. What kind of contacts are people with working TS-520s making these days? Anybody earned a WAS or some other distinguished award with their great old Kenwood? I read up on J-poles a while back; is that type of antennae effective with these rigs?

Hi Bill,
Welcome to ham radio!! The short answer to your question is that 520s that work well are making the same kind of contacts as modern rigs. Disadvantages are the fact that the finals must be re-tuned as you change frequencies or bands, and without the external VFO they cannot work split frequency. They also do not have the most recent bands that were given to us, the 30, 17, and 12 meter bands, but there are plenty of contacts out there without those frequencies. Perseverance can overcome these setbacks and the 520 will give you a lot of enjoyment.

The best way to accomplish what you want with an older rig is to get up the best antenna you can, obtain a CW filter, and get on A LOT. Much depends on being in the "right place at the right time." And listen, listen, listen! Try to get to the DX stations before everyone else does.

I am not familiar with HF J-poles but maybe someone else in the group is.
I hope to see you on the air sometime.

I can't answer regarding the VFO-820 (actually I'm looking for a VFO-520S to match my SE for appearance) but I can speak to the contacts. My station set up is a TS-520SE running thru an MFJ 945 C tuner to a more or less 20 meter wire dipole hanging about 14 feet in the air and an Astatic Black Eagle lollipop microphone. It's probably pushing less than optimal wattage down the coax as I've abused the tubes learning to use the poor thing. On 20 meters, SSB, I have recently completed contacts to Poland, New Zealand's South Island and Hawaii with 55 to 59 signal reports, all from a deep mountain valley in Utah with very poor ground. So, get your general, hang up some wire and get on the air. You can work 'em!

Hey, Bill. Welcome!

I don't know if a VFO-820 will work with a TS-520 or not but, really, you don't need it until you are very comfortable operating and then start trying to work DX on split frequencies. Your TS-520 is a great little rig -- don't let anyone tell you otherwise. You can work the entire world just fine with it.

I've never heard of an HF J-Pole so I can't comment.

My advice? Put up a dipole as high as you can and as long as you can. Feed it with 450 ohm "ladder" line and use an antenna tuner. Then GET ON THE AIR a lot.

After a while, you'll form your own opinions about antennas, operating methods and modes, and equipment.

Above all else, have fun!

73,

William,
I just have some additional thoughts about the HF j-pole antenna. These are really popular in my area for 2 meters and up, but for HF they get really cumbersome, the physical size of the thing makes them difficult to impossible to construct, plus a little pricey. Second, j-poles are usually vertically polarized, HF operators usually have horizontally polarized signals. So on HF with a vertical antenna one usually gains lots of noise, static, hash (which in general is vertically polarized) while losing a portion of the distant station's signal. A horizontal dipole cuts much of the noise and grabs more of the signal, according to theory.

Hope to make contact with you on the air soon.

Well, I don't have a TS-520, but I own a TS-530S (very close relative). I'm currently living in an apartment complex, so my antenna options are quite limited. In fact, what I have is a wire that goes out from the back of the radio, thru the window, and is bolted to the rain gutter on the other side. I don't (yet) have a WAS award, but I've worked 47 states and 4 provinces with that setup on 40m (I suspect I'll have to wait a bit later in the year to hope for Alaska or Hawaii on 40m! ...and the other one I'm missing is just a rogue -- Utah. I'll get it, soon, I'm sure). I also regularly check into state-wide HF nets on 80m, using the same setup.

If you're REALLY dying for a digital readout, I've got a friend's TS-530SE here that he asked me to sell for him... ;)

At 502 VFO will work the same as an 820 VFO at least according to the internal schematics. As to working DX with an old rig, doesn't matter. RF
is RF, 100 watts is 100 watts. The antenna is what matters. Go vertical
for good DX and horizontal for good local contacts.

Just my opinion but unless you are looking at doing some kind of collector type stuff, I do not find the split VFO as big of a deal as it was many years ago. I have had it on my new rig for over six months, and have have worked over 35 countries with that rig without a thought to split stuff. Over 50 countries with the 820s I bought a couple of years ago without a thought to it. Somebody here said that it is in the antenna. Dead onwith that. Had mine up aabout 50 feet until a storm a few weeks ago and the ham band were total open season for me. I lost 15 feet and I now have to compete. 100 watts on one and a bit more on the other rig.

If your 520 is sound and has decenet output, place that as number one priority. If you know how to convert to a three prong cord, do that too. If you have sticky gooey bandswitches, go there. If you want split stuff talk to others on how much they use it before you open another can of worms.

The big deal to splits with me was back in the 60's and early 70's on 40 meters. Really cool DX would hang out 7.085 or some off the wall freq where they would not get killed by the broadcast stations. They would listen 7.000 plus, and since the bradcast stations were in their back yard to a great degree did not impact them as much as us, thus splits were pretty cool to have. Some of the WARC add ons and other factors to me have reduced the demand for splitting although it still does go on toa certain extent, but ask around!

Good luck

for a novice please explain "convert to a three prong cord"??

is this a multi wire antenna?

Split capability is still a big deal in working DX on 40 and 75 SSB.

ROGER ROGER on the antenna.
See Lew Mcoy on antennas. You can NOT do any better for all band coverage than the longest dipole you can run fed with twin lead and use a tuner.

Hey, Bill. Welcome!

I don't know if a VFO-820 will work with a TS-520 or not but, really, you don't need it until you are very comfortable operating and then start trying to work DX on split frequencies. Your TS-520 is a great little rig -- don't let anyone tell you otherwise. You can work the entire world just fine with it.

I've never heard of an HF J-Pole so I can't comment.

My advice? Put up a dipole as high as you can and as long as you can. Feed it with 450 ohm "ladder" line and use an antenna tuner. Then GET ON THE AIR a lot.

After a while, you'll form your own opinions about antennas, operating methods and modes, and equipment.

Above all else, have fun!

Subject: [TS-520_820_530_830] Hello to group!

I am a newly licensed No-Code-Tech. Hoping to rectify that shortly by passing the General Exam with code or wait for FCC to eliminate code requirement all together. My equipment consists of a Kenwood TS-520 sans CW filter and matching speaker and mike. I am on the lookout for a VFO-520. I think I did see a VFO-820 <http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&rd=1&item=5711043982> on

eBay, but don't have a clue if that will work with the older TS-520.
What kind of contacts are people with working TS-520s making these
days? Anybody earned a WAS or some other distinguished award with their
great old Kenwood? I read up on J-poles a while back; is that type of
antennae effective with these rigs?

73, KI4CYM, Bill

would a triple wire dipole be better than a double size g5rv.

I am fortunate that room is not an isse and there are two 60 year old
pines about 500 meters apart that I could hang the antenna from.

the groups thoughts on this would be much appreciated.

I've had both. Although the 3 element dipole was convenient (no tune) on many frequencies, there were still some frequencies I couldn't work without a tuner. So, since I needed a tuner anyway, the large G5RV was an excellent compromise. The 3 element dipole was always getting tangled up, was susceptible to QRN and harmonics (TVI).

If I had that kind of room now, I'd put up the G5RV or a Lew McCoy.

That's the antenna I use most of the time, and I agree--it works great.
Mine is 400 feet long.

The hybrid rigs come with a two wire cord, which
leaves the chassis a little 'hot' to ground if you
don't have a ground wire connected to the rig. By
adding a three wire cord with safety ground to the
power connector, you get rid of this problem. I am
fixing to do it to my Johnson Valiant; it also helps
reduce audio hum. Sure helped my guitar amp too.

Most if not all DX'peditions will work split frequency. If you do not have split frequency capability,
forget about working any rare locations around the planet. The addition of an external VFO to
allow one to work split is an huge enhancement to your over all station flexibility with only a
minimal cost.

The ability to work split, is a capability you will one day wish you had when you find yourself
listening to that rare DX that everyone else is working. You will be on the outside looking in.

Of course, if you do care about working DX'peditions or rare DX, then forget what I said here.

Subject: [TS-520_820_530_830] Re: Hello to group!

Just my opinion but unless you are looking at doing some kind of collector type stuff, I do not find the split VFO as big of a deal as it was many years ago. I have had it on my new rig for over six months, and have have worked over 35 countries with that rig without a thought to split stuff. Over 50 countries with the 820s I bought a couple of years ago without a thought to it. Somebody here said that it is in the antenna. Dead onwith that. Had mine up aabout 50 feet until a storm a few weeks ago and the ham band were total open season for me. I lost 15 feet and I now have to compete. 100 watts on one and a bit more on the other rig.

If your 520 is sound and has decenet output, place that as number one priority. If you know how to convert to a three prong cord, do that too. If you have sticky gooey bandswitches, go there. If you want split stuff talk to others on how much they use it before you open another can of worms.

I must agree with you it has happened to me twice now where i have been unable to work rare Dx because they were working split. I have two problems one i can not find a vfo and two when they do pop up they are silly prices that i can not afford. Amateur radio seems so much cheaper over in the US. I shall keep searching though. all the best from Nigel M0dbo

Nigel;
I used a MFJ Grandmaster on both my Heath HW 101 and my TS803 for many many years. It uses a three wire shielded cable (-/+ with shield) all that is needed is to wire the cable as needed. Should have no problems, lots of used ones around.

Standing corrected, did not realize that much of it was still going on. I guess it is just more a change in my operating preferences over the years that I do not notice it at much, so I guess it is good to have it built into the 718 at least, if I ever use it.

You actually have a number of choices. I cannot remember where, but do searches for grid block adaptor specific to google, and you will find a few sources for under $10.00 USD. I just checked. That way you can use any keyer you like. Another as was mentioned is MFJ. I have one and not overjoyed with it, but it has jumper control to use either way. Go to their web page. You can download the manuals to all keyers and determine whether it has the jumper control or not. They still build them that way on several models. I have the 407d

2160. question on tuning 520S

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-07-26 01:18:46 UTC
From: georgesimmans
Topic: 2160 Message: 2160

Hi all,

My question relates to tuning a 520S into a dummy load.
I follow the manual procedure the last part of which states switch to cw mode, set the meter switch to RF and flip the send switch .quickly adjust both the plate and load to peak the meter.

well My dummy load has a watt meter and using this method I get 90 watts output but If I use the plate and load and maximise the output wattage on my dummy load this is past the maximum deflection on the 520s meter, and shows just over 100w.

My question is is it safe to tune for maximum output on my watt meter and ignore the 520s meter?

Many thanks for an interesing and informative message board.

george

2161. Re: [TS-520_820_530_830] ts520s tuning rf meter vs dl meter

Hi George,

Please see section in the manual for RF Volt adjustment,
you set the meter to read 2/3 scale for max rf out.

The adjustment is made from the side panel.

(page 14 for the ts-520 manual)

Won't make a hill of beans the extra 10 watts. However, your question depends. Depends
on which meter you trust more. Just make sure your SWR is reasonable and have at it.

go for the gold, whatever method you use, and stay
with that method. We can fret over ten watts, or get
on the air and have fun.

It's an interesting phenom, but I am not surprised.
Where the wattmeter is placed in the line has a lot to
do with variations like this.

Thank you Bill.

I was only concerned that I may be transmitting slightly out of resonance
and thus shortening the life of the finals rather than any concern for
the extra 10 watts... many thanks for your comments.

2165. HELP....Somehow let the "smoke out of the radio "

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-07-27 10:22:55 UTC
From: dynamic881964@yahoo.com
Topic: 2165 Message: 2165

Hi All,
Well, my friend was up last week, we planned to get on the hf bands with my 520s , G5RV, and MFJ 949D antenna tuner.
Tuned the rig up on 20m as per instructions in the Kenwood manual,first into the dummy load built into the MFJ, then into the antenna... George got
on the air, began calling CQ ...after about 20 mins,(Not continous, he called CQ for maybe 3 mins at a time then listened for replies) with no replies,
we switched the rig to 40m, again went through the complete tune up procedure as per the manual, and after about 20 sec. of him calling CQ, the panel lights dimmed and we began to smell smoke (though we didn't see any). Any idea's on what cooked and more importantly why ? We had the G5RV down to a 1:1 to 1 match on both bands so am sure that isn't the problem. The tubes are all new, and the finals are a matched set.
We let the rig cool down (?) turned it on with the heaters off, and no problems, it recieved as though nothing was wrong. Tried tuning it up again on 20M, with the same thing happening as before. Shut it off and upon checking saw that apparently before I got the rig, someone replaced a fuse with a 10 amp fuse. (Never crossed my mind to check the fuse until this happened.)
One other question, when tuning the rig up it tells you to turn up the carrier control until you get the proper ALC reading, which we did. It doesn't mention turning it back down in the tune up procedure, but we both assumed that running SSB , you would turn the carrier off and increase the Mic gain until you got the proper ALC reading. (?)
What did we do wrong or was it just time for some component to fail ?
Anyone know a good repair tech I can send the rig to ? Home QTH is Michigan.
THANKS in advance for ANY and ALL help !
73 for now,
Dave, KC8YOX

2166. TS-530sMeter not reading on RF

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-07-27 14:23:59 UTC
From: Bob M
Topic: 2166 Message: 2166

I recently connected a AT-250 Auto Tuner to my 530s
Since then when Tuning up my Radio akk goes well
untill the last stage. Peaking the Load and Plate.

I get no deflection at all on the 530's meter either
with or without the tuner.

It has been sujested that a diode in the RF circuit
has blown does this sound right to you guys and is
it an easy replacement to do.

I am currentlt peaking for maximum poer output on the
tuners meter.

Regards
Bob M.

Dave,

put a 5 amp fuse in. If it blows, you have problems.

Note when it blows; and what you were doing at the
time (transmitting, carrier, about x watts out,
whatever).

If you are smelling smoke, I would guess most likely
it is a PA tube failing. There are several things that
will burn if this happens.

bill
I am in denver by the way.

The RF Meter pot in the back of the radio, upper right
side (left, if you are facing the back of the rig) may
just be dirty. move it a round a bit and you may see
deflection.

2169. TS-520SE VFO dial bulbs burned out

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-07-29 03:37:03 UTC
From: grc1939@excite.com
Topic: 2169 Message: 2169

Hello All,
I recently acquired a TS-520SE. It appears that the two bulbs for the VFO dial are burned out. I noticed that there are several postings that refer to replacing the meter bulbs but not much information about replacing the VFO bulbs. Does anyone have any ideas about how to replace the VFO bulbs? They appear to be much more difficult to remove than the meter bulbs. Even removing the front panel does not look like it would be any help. The top VFO bracket is the problem. Message 1266 describes cutting the back off the grommets to allow removal of the old bulbs and provide a hole big enough for inserting the new bulbs. Is there some kind of device that could be used cut the back off the grommets under the bracket? If this could be done, it appears that installing the new bulbs would be relatively easy. Thanks for your help.

Bill as usuall you are a gem.

It wasn't dirty but while moving the 530s around I must have knocked
the pot to a lower setting almost off, I have adjusted it to 2/3rds
RF meter when in CW and using the Send/rec toggle switch.

IS that the proper range and can you please explain to me what it is
used for and purpose.

Regards

2171. Notch filter for the TS-530s??

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-07-29 12:17:37 UTC
From: Bob M
Topic: 2171 Message: 2171

Is there a Kenwood notch filter available for fitting into the 530s

If not is there a basic one that I could build for it.

I have a 80mtr net on 3.580.0 on thursday nights and almost every week I am hounded by a 50/60 cycle harmonics if the net moves 5k's either side i can deal with it but most weeks they will not move due to band clutter.

It has been sugested that a notch filter will help me.

Open to any and all Help.

It's strictly a relative RF voltmeter; set it
whereever you want. 2/3 full scale at 100 watts into
50 ohm load is good... if you have excessive SWR, the
meter will read much higher. My limit is: when the
meter is set to 2/3 into a dummy and it goes full
scale on the antenna, check the swr!

Try one of those SCAF audio filters... I think MFJ
makes one. I don't know if an IF notch filter would
help as it would have to be pretty sharp to catch
stuff close in, and you would need multiple filters to
catch all the little carriers.

Have you tried locating the noise source? Most of mine
were or are switching power supplies in my own house.

Idiom Press does a SCAF filter at $90.00 US in kit and I think $130.00 assembled. Eham.net has a lot of good refs on it and I have waffled myself to death with the limited budget on what to do, but looks like what I will probably settle on. Talked to the guy there and says it is no issue at all driving speakers, which is the problem I have with the old stuff around here which is headphone only. They have recorded demos on their site, although I always take them with a grain of salt. Email the users from eham. net or talk to them personal would be my advice.

Hi Keith!

Yes we did, forgot the guitar but that's ok... still
had fun.

Doing it again this weekend.

we like to go up on weekdays; have the entire mtns to
ourselves, hi.

No DSP; I just go to narrow filter modes if the noise
gets too bad.

2179. 830s tuneup

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-07-31 02:46:56 UTC
From: carboncarolina78
Topic: 2179 Message: 2179

Hello,
I just signed on as a new member last week and have a question.
I see in the file section K1cz has drawn up a tuning procedure for an 820s. Would this be basically the same procedure for an 830s as I recently purchased a very nice one? I'm still a Tech, but passed my General written and am working on code now. I'm sort of out in the boondocks and don't have anyone real handy to help. I've put up a 300= foot horizontal loop and it seems to receive quite well. As soon as I turned it on I got a good listen to a mobile on I-15 near Payson Utah from here in Bradford County, PA on ten meters.

Hi,

Yes, you will find most tube type amplifer radios
use similar procedures.

I remember Drive Plate Load and also keep a
copy of the tuneup section in a plastic protector
near the radio.

Enjoy the 830 !

Subject: 830s tuneup

Hello,
I just signed on as a new member last week and have a question.
I see in the file section K1cz has drawn up a tuning procedure for an
820s. Would this be basically the same procedure for an 830s as I
recently purchased a very nice one? I'm still a Tech, but passed my
General written and am working on code now. I'm sort of out in the
boondocks and don't have anyone real handy to help. I've put up a
300= foot horizontal loop and it seems to receive quite well. As soon
as I turned it on I got a good listen to a mobile on I-15 near Payson
Utah from here in Bradford County, PA on ten meters.

Wow, what a blessing to catch a 10 meter opening right
off the bat like that!

Yes the tuning procedure for all of the hybrid
(transistor/tube) rigs is the same, pretty much.

Make sure you use an SWR bridge to check that antenna
at low power before using it. You want your SWR to be
less than 3:1 on your favorite frequencies. You may
need a tuner with it, or cut an antenna just for one
band to get going.

Welcome to the group, by the way.

73,

Bill K0ZL

Thanks to both you and K0ZL for the replies. I have a good friend who's had his ticket since 1957?, who recommended the 500/800 series as a good used HF rig. Unfortunately he's in Utah and not very available. Even though I'm very new and green at this, I like the idea of working a little for results, and figure it has to be somewhat fun versus just pushing a couple of buttons and off we go. :-) My first radio was a Kenwood 7400 and I've been totally impressed, Dan recommended that one too...built like a tank and solid! I have a 2 meter handheld which has PL capability etc., but I still like that 7400! Now I have am MFJ 9406 coming from an old ham out in MO. It's fresh from being gone over and retuned etc. and though I couldn't initially afford it, he cut me a break, because he said he's been a ham for 54 years...didn't have a "lot" of time left and was glad it seemed to be going to a good home where I would put it to good use. Some (most) of the vocal 6 meter group doesn't have much good to say about it, but all the reviews at Eham.net were quite favorable. I guess we'll see. I'm 47 and still remember my dad's old Hallicrafters receiver in my room as a kid. I'd turn it on and listen to all the foreign stations and the CW, with that big green glow at night. He would check his watch every morning according to GMT before he'd go to work. One day it literally got tossed out the window when I was overseas in the army as it caught fire. However he still had a National NC57 which I'm getting restored. My grandfather was a telegrapher for the Lehigh Valley Railroad and I found out later was also the neighborhood radio repairman. Hopefully I've been blessed with some of those genes also. By the way, I do have an antenna tuner for that setup I have.
Thanks again,
Steve

Can any one tell me how many microvolts should give s1 and s9 on the
s metre,into the antenna socket.I believe that this should be done on
14.174mhz ,adjusting L8 and VR2 respectivley.
Regards
Bob/G7JHW

2185. Re: [TS-520_820_530_830] ts530s s metre setting

Yahoo group: TS-520_820_530_830 (2001 — 2004)

From: Bill K0ZL
Topic: 2184 Message: 2185

50uV for S9, and S1 can be a quiet part of 10 meters,
on a short piece of wire in the house. Tune off any
carriers from computers etc.

I turn the S0 setting so the needle just comes off the
peg with anything connected to the antenna connector.

---> My reply to what TS-520_820_530_830 wrote 8/5/2004 6:55:23 AM

You would set the 520 to the 28.000 band. 28.100 would give you 144.100 output
(assuming you have the switch on the 506 set to the 144 range) and so on.
28.200 will give you output of 144.200.

2195. Re: Kenwood TV-506 6 Meter Transverter Manual

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-08-05 20:50:58 UTC
From: Brent Baum
Topic: 2186 Message: 2195

The TV-506 is used with the TS-520 or TS-520S (and similar), and is the 6 meter transverter (50 MHz). The TV-502 is the 2 meter transverter. Easy to use, set your big rig to any of the 10 meter (28 MHz)channels using the frequency selector switch. 50.xxx plus the digits after the decimal point on the frequency readout will be your tx/rx frequency, i.e. 28.474 will translate to 50.474, 29.311 is 51.311, etc.

By the way the TV-50X series transverters will not work with a TS-520SE in stock condition. I'm in the middle of making modifications to my SE to change that situation.

I'll check for a manual when I get home this evening.

73 de Brent, K7MEI, proud owner of a nice, but so far inanimate, TV-506.

2200. TS 520s and ts 530s low power

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-08-06 01:45:47 UTC
From: junkyardham
Topic: 2200 Message: 2200

hello all,

I've read a few things around about operating low power SSB on these rigs,(I have an amplified TV antenna in the attic next to an 80 meter slinky dipole), but I'm still stuck with a few unresolved questions...

1. The schematics I've seen say to use a 220k ohm variable resistor in circuit with a 9 volt battery to inject a negative voltage into the ALC input on the back of the rig

2. Another place said to use a 5 or 10k ohm pot in this circuit

which one is it or will both work, just at different levels and precision of control?

3. One message I saw said that the guy had trouble with some capacitors overheating when using low power. Is that a problem with the SSB mod or just the CW technique of lowering the "car" setting?

thanks

2202. DG-5 Digital Display displaying random numbers on 10 meters

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-08-07 15:51:31 UTC
From: grc1939@excite.com
Topic: 2202 Message: 2202

Hello Everyone,
I recently acquired a DG-5 Digital Display to go with my TS-520SE. It displays constantly changing random numbers when the TS-520SE Band switch is in the 28 and 28.5 positions. It displays properly on all other Band switch positions including 29.1. I was not able to get the original cables so I am using standard Radio Shack type patch cables with RCA phono plugs. Can anyone provide any information on how to get the display working properly on all bands? Could the cables I am using be a problem? Thanks.

2203. TS-830S Erratic ALC

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-08-08 03:13:39 UTC
From: au20061
Topic: 2203 Message: 2203

I just received an 830 and it receives great......is right on frequency.....and loads up to 100 watts plus. I also got a good audio report on my first contact. The problem that has developed is erratic alc on tuneup. The alc seems very jumpy. As you turn the carrier control it goes from zero to past the alc scale in a quick jump. The rig will tune up and work and then alc will drop to zero.

I have not checked anything yet. I will clean the switches first and then check the tubes. Anything other ideas to lead me to the problem.

Thanks

Tom

2204. Re: TS-520SE VFO dial bulbs burned out

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-08-08 13:06:02 UTC
From: Glenn Crawford
Topic: 2169 Message: 2204

Hello again,
I have replaced the bulbs. Removing the front panel did help. I was able to remove the old burned out bulbs by carefully pulling them through from the front with tweezers. However, in the process of cutting off the back of the grommets, I damaged one of them. It is still usable but somewhat mangled. This was caused by trying to learn the best way to do it. When I used an Xacto knife, it came right off. Does anyone know a source for these grommets? Thanks.

> Hello All,
> I recently acquired a TS-520SE. It appears that the two bulbs for the VFO dial are burned out. I noticed that there are several postings that refer to replacing the meter bulbs but not much information about replacing the VFO bulbs. Does anyone have any ideas about how to replace the VFO bulbs? They appear to be much more difficult to remove than the meter bulbs. Even removing the front panel does not look like it would be any help. The top VFO bracket is the problem. Message 1266 describes cutting the back off the grommets to allow removal of the old bulbs and provide a hole big enough for inserting the new bulbs. Is there some kind of device that could be used cut the back off the grommets under the bracket? If this could be done, it appears that installing the new bulbs would be relatively easy. Thanks for your help.

Could be dirty carrier control, or broken bandswitch
coupling, or oscillating driver tube, in that order.

Hey All,

I've been lurking about for a while, but it looks like it may be time to get active. Saturday brings the local VE session. I figure on probably passing element one, & possible element three as well.

I have on hand a TS520/VFO520 combo. Planned antenna is about 120 feet of random wire up ten or so feet. As I'm in a fround floor apartment, I'm happy to get even that much wire up. Other than a dummy load & a low pass filter, any station suggestions. Trying to balance cost vs effectiveness if possible.

Also, any recommendations for grounding? Plastic pipes, & permission for grounding rod denied by landowner. Lightning protection will be disconnect & unplug. Had a strike hit the swimming pool about six weeks ago. That's twelve feet from the operating station!! BTW, lost NO electronics within the complex. AC mains never even flickered!!

Thanks to all!!,

DW

GL on the VE test OM.
If you are running a longwire a good ground and some sort of counterpoise is recommended. Is there a ground rod for the electric service that can be used? You're going to need a tuner of some sort. A simple LC network will work for a longwire. That can be made easily; wind the coil yourself and tap it where needed, pickup a cap at a hamfest or at Surplus Sales of Nebraska.

The ground is important. Ground to the electric ground at the AC recepticle for electrical ground. Get some wire on the ground in the form af radials or one long counterpoise. Even if you have to roll them up when not in use. Or bury them in the shrubs or flower beds. This will eliminate more RFI than any low pass filter will.

Longwire will require a tuner and counterpoise or
ground.

Counterpoise will need to be min of 1/4 wave at lowest
frequency. Where it presents a 1/2 wave, there will be
severe RFI in the shack.

Good luck.

Good luck on the exam. Hope to CU on the air soon.

Apartments are tough. First, change the power cord on your TS-520 to a 3-wire cord (you know, with a grounding prong)-- secure the green grounding wire to the rig's chassis. This will help keep dangerous AC off your fingers and help with the RF.

Go to Radio Shack and buy a few rolls of that aluminum foil tape you use to put on windows for burglar alarms. Run a very short stranded or braided wire to a point near the floor. Fasten several pieces of the aluminum tape to the point and spread them in different directions all over the apartment -- you can stick them to the baseboards, floors under rugs, even walls. The longer each is the better but be sure you have at least 4 or 5 of significantly different lengths so that if one is resonant at a particular frequency, the others will not be.

If you don't feel that your taped up ground system is adequate, you can find MFJ's "Artifical Ground" on eBay. Or, use a cheap small antenna tuner to tune your counterpoise system to perfection.

Finally, get a straight key.

73,

--Ron (KZ7P)

From: Eric Webner
Topic: 2208 Message: 2213

Hi all,

Just to add my two cents:

Go to ARRL Web and search grounding. I happened to do the same thing today and read an article on setting up a counterpoise, which is one of the techniques that Ron discussed. According to the information I read, rather than using random lengths of window tape or wire, there should be one that is a quarter-wavelength for each band you wish to work. Each one provides a low-impedance at that frequency. Keep the bends as gradual as possible (12 inch radius or more).

If you rewire the AC cord with a 3-wire plug, you will be putting unusual currents (RF) through the safety ground of the electrical system, which the National Electric code frowns upon (although they say that all ground systems should be bonded together).Perhaps the best thing to do if the rig is a little "hot" is to reverse the AC plug. Too bad it is not polarized!

Another suggestion on the antenna: a random length antenna requires a particularly good ground in order to avoid ground losses. I am not sure what your setup is that the landlord will allow the antenna and not a ground rod, but if you could put up a balanced antenna, you would be better off.

At one time I lived by myself on the third floor of an apartment building. My station used a center-fed Zepp antenna, with which I ran all bands 80-10, on my TS-520. I ran 300-ohm twinlead through a small hole just below my window and attached it to my 80-meter dipole, made with 30-guage magnet wire. I attached each end with fishing line and an appropriate weight, one end to a tree, and the other to a lampost. It was very stealthy, though it required a bit of maintenance, as ice storms tended to break the wire.

My ground system consisted of 1" tinned copper braid that I ran under the carpet and attached to the bathroom sink's cold water pipe. I wouldn't recommend that now, but it worked for me. How I avoided problems with that ground, I'll never know!

Oh yeah, and get a straight key.

73,

Eric KA8FAN

Ron Kienzle <ron@...> wrote:
Good luck on the exam. Hope to CU on the air soon.

Apartments are tough. First, change the power cord on your TS-520 to
a 3-wire cord (you know, with a grounding prong)-- secure the green
grounding wire to the rig's chassis. This will help keep dangerous AC
off your fingers and help with the RF.

Go to Radio Shack and buy a few rolls of that aluminum foil tape you use to put on windows for burglar alarms. Run a very short stranded or braided wire to a point near the floor. Fasten several pieces of the aluminum tape to the point and spread them in different directions all over the apartment -- you can stick them to the baseboards, floors under rugs, even walls. The longer each is the better but be sure you have at least 4 or 5 of significantly different lengths so that if one is resonant at a particular frequency, the others will not be.

If you don't feel that your taped up ground system is adequate, you can find MFJ's "Artifical Ground" on eBay. Or, use a cheap small antenna tuner to tune your counterpoise system to perfection.

Finally, get a straight key.

73,

2221. VFO-230 with TS-830

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-08-18 01:48:50 UTC
From: Roy Sakabu
Topic: 2221 Message: 2221

Hello Group,
I recently picked up a VFO-230 to compliment my TS-830. One reason I got it was that I was told that with the VFO-230, there is virtually no warm-up drift in the frequency when using it to control the 830. Well, upon starting them up, the VFO-230 will transfer frequencies from the 830 properly and will smoothly change its frequency display properly, but will not properly control the 830, as you spin the dial on the 230, the 830 only responds when you QSY by about 10 kHz. After about a half hour warm up, it controls the 830 perfectly.

Is this to be expected, or is there something that needs to be checked out?

Thanks,
Roy

This is a reply to my own post. I have changed the driver tube, cleaned the band switch, cleaned the tx/rx relay, and cleaned as many pots as I could access. The rig is loading up much better. Just completed a qso with a W2 on Long Island and got an excellent signal report on ssb using an indoor dipole. I have been using the processor on 40 meters and getting excellent audio reports. The processor on the 830 is the best I have used. Does not distort and really punches through the QRN on 40 at night.

I believe the band switch was the culprit.

If you get into a pinch, You might be able to go to google and do a search for a particular radios mod. When it makes reference to mods.dk and list a page for a particularnradio go the the CACHED page. there will not be any pictures and it will be ugly but you may be able to retreive enough text to do what you need to do. I was sucessful on my mobile radio last night.

Check your screen voltage and your grid bias voltage
at the tubes; you should see some variation there if
those are the problem.

Otherwise, you may have problems with the hi-voltage
filter caps going out. This will drop your plate
voltage to half, power output to 1/4 (25 watts) and so
forth, but not necessarily blow fuses or smoke.

2237. flickering display tube

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-08-22 15:14:34 UTC
From: emporiaars
Topic: 2237 Message: 2237

Hello all, Name's Mike. Located near Emporia, Ks. Working on the General ticket. Blasted hearing and code not real compatible but I,m getting there. The xyl decided to cut and run after 24 years, so it is just myself and my 14yr old son. Amature radio has kept my mind occupied and is an untapped source of friends.
I have a TS-820 that I got from e-bay two years ago. Two weeks ago at the ARRL Ks. State Convention I bought a TS-820S, AT-200 tuner,SP-820 Speaker,VFO-820,MC-50 mic, all manuels, boxes, and connecting cables for $150. It works too. But it did fill my Jeep wrangler.
I have started cleaning the interior of them and need to know what to check on the flickering display tube of the 820S.
I hope to find the 2m & 6m transverters later on. Even the monitor. I'll need a bigger desk!
Thank you for any tips and help that I get. 73 Mike KCØNFG

From: Bill K0ZL
Topic: 2237 Message: 2238

ok Mike, well sorry to hear abt the personal
situation; that's always a heartbreaker.

There for a second I thought you were running the 820s
mobile in the Jeep! ha...

Not sure on the flickering display but my first step
would be to take the counter out and clean all the
connectors with Cailube MCL or DeOxIt on a foam-tipped
applicator. But that's just me.

Have fun, enjoy the group, and you are right, amateur
radio can be a sanity-saver for sure (unless you
decide to set up a Yahoo group, or three, but that's
another story for another time!).

Mike, Welcome to amateur radio. It can be a great time and there are lotsa potential friends out there. I'm relatively new myself and am also studying for upgrade. I passed my General written once, but didn't get on the stick as far as code and now I've gotta retake...after I do code this time. :-) I had to put my tongue back in after reading what you got that entire 820 rig for. If he's interested, be sure to get your son involved. Another group I belong to is the HamRadioHelpGroup here at yahoo. It's a great bunch and they are extremely friendly and willing to help newcomers. Take care, Steve Hall KB3IOJ

Hi Mike,

Enjoy your newest radio.

Another station saved from the auction sites.

I agree with Bill, be sure to blow out the finals
cage and a few drops of oil to the fan bearings too !

The deoxit also works well on the coax, mike connector and pots.

2242. TS-820S "shifted" IF Shift

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-08-24 02:32:21 UTC
From: dimitrip@tiac.net
Topic: 2242 Message: 2242

My 820S' IF Shift seems to have developed a problem. In order to hear the audio "normal" it has to be turned fully clockwise position and then it still seems to "need a little more".

Turning it from the 12 o'clock position fully counterclockwise has absolutely no effect on audio.

I attempted to take a stab at the USB LSB offsets but discoverd my Frequency counter has given up on me as well, so while I am contemplating getting a new counter, I'd appreciate any pointers towards correcting this problem.
BTW, assuming my counter is correct, at both the USB and LSB position the frequency a) is way off AND b) it didn't seem to change between USB/LSB. The frequency measured at TP5 of the IF board was 8.82621 MHZ

Thanks,
Dimitri

2243. Re: [TS-520_820_530_830] TS-820S "shifted" IF Shift

Yahoo group: TS-520_820_530_830 (2001 — 2004)

this control uses a DC bias to change the varactor
offset. Could be that the -6 volts that supplies one
end of the pot, I believe, is gone.

2244. Re: TS-820S "shifted" IF Shift

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-08-24 23:58:26 UTC
From: dimitrip@tiac.net
Topic: 2242 Message: 2244

The pot(10K) has +9 on the "hot" side and is connected to ground via a
1.8K resistor.

The way it "works" now I get about 5.1 volts fed to the CAR1
board,when it is turned fully clockwise.

I calculate that the 5.x voltage is close to the correct voltage for
the IF Shift pot in the middle position when not malfuntioning.

In the middle position I calculated the voltage fed to the board to be
5.2 volts

Time to figure out how many screws it takes to get to the CAR1 board :)

Thanks...I might be getting somewhere.

C18 .22 ufd on the CAR 1 board was leaky. After replacing it, IF Shift came back to normal.
I used a metal film cap instead of an electrolytic (the only type the local RS had in stock).

Great idea for the database. Not to be picky, but my schematic
shows C18 (&C17) on the CAR-1 UNIT (X50-1310-00) to be .022 ufd
rather than the .22 mentioned.

Ooops!
It's not C18, its C8 (0.22ufd) that was leaky.

Thanks for pointing it out.

Dimitri KF6QEX

It is C8 that was replaced

Topic: 2242 Message: 2254

Bill,

Since you are starting a database of repairs - here's one that I did on my 830...

I had a problem with the fact that the CW sidetone oscillator wasn't working. I traced the problem down to a cut wire on the mode switch. But, that wasn't the real problem! Once I repaired that wire, I found that the CW sidetone was on at all times in CW mode. Evidently, one of the previous owners of the rig couldn't find the reason why the sidetone was stuck on, so then must have cut the wire to eliminate the sidetone permanently.

So, I set off to find the "real" problem.

The clue that got me looking in the right direction was that I could squelch the sidetone by "shorting" the key with my fingers. Actually, the small amount of leakage provided by my fingers across the key terminals was enough to turn off the oscillator. Of course, keying the key turned to oscillator on. So, I was left with a circuit that would turn on when the key was open circuit, and when it was closed circuit - and would only turn off when a few hundred Kohms (fingers) across the key.

I traced the problem to the switching diode, D1, in the sidetone phase-shift oscillator on the AF Unit. I found that the diode would get leaky when its reverse bias exceeded about 35-40V, and then its impedance would drop enough to permit the oscillator to startup. Putting my fingers across the key terminals would drop the keying voltage down to about 30V, and cause the diode to stop leaking. I replaced the diode with an NTE177 - and it is fixed.

Hopefully, someone else can benefit from this...

73,
Alan W2AEW

Look in the group's FILES section; there should be a
document there describing how to do it.

2263. TS-820& TS-820S tubes?

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-08-31 02:13:47 UTC
From: emporiaars
Topic: 2263 Message: 2263

Hello, Being new to the 820 seen and starting to refurbish not one but two of them I'm trying to find out the driver and final tubes that will work in this rig? And what works best in them. I'm wanting to have a spare set of these on hand. What is acceptable and has anyone came up with a tube replacement for our rigs? I hope that I don't get strung up for that question! I like the older equipment and want to be able to keep it up myself hopefully. I've always been a hands on guy, 14 years G.M. Mechanic, last 16 years mechinest.
Thanks, Mike KC0NFG

2264. Re: [TS-520_820_530_830] TS-820& TS-820S tubes?

Yahoo group: TS-520_820_530_830 (2001 — 2004)

From: Bill K0ZL
Topic: 2263 Message: 2264

OK Mike.

Well, just about any 12BY7 will work. I like the ones
that are "pulls" from Tektronix scopes of old... these
are usually quite tame and less likely to oscillate
than the new ones. At any rate, always try another if
you see drive jumping around un-smoothly as you rotate
the DRIVE tuning control.

Don't throw out any unsteady ones, as these may work
in another rig just fine.

On the finals, seems like GE NOS 6146B are the way to
go. They don't have to be a matched pair but should
look the same internally as there were some minor
construction differences in some tubes.

Sylvanias work too and if you are lucky enough to find
a pair of the original Toshiba S2001s, GET
THEM...these darn things last forever.

Hi Mike,

I agree with bill.

http://www.surplussales.com

has GE JAN finals and drivers at reasonable prices,
look at tubes and specials.
I have used him many times (not just for finals !)

Don't worry, nobody will string you up for asking
questions but watch out, you may get setenced to
serve on an antenna or tower crew !

2266. ALC on steroids?

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-09-01 23:28:58 UTC
From: vk7rl
Topic: 2266 Message: 2266

When operating my 530s on SSB I get max ALC with the mic gain at 9 o'clock position using the standard hand mic (the manual suggests 12 o'clock). The trouble is on certain words, like four etc., the meter needle pegs hard to the right.
It's impossible to keep the meter within the ALC zone unless I turn the mic gain to almost zero!
Rig is correctly tuned into a suitable load and on CW max ALC coincides with max power out.
Anybody got any ideas?
Rick

2268. Re: [TS-520_820_530_830] ALC on steroids?

Yahoo group: TS-520_820_530_830 (2001 — 2004)

Topic: 2266 Message: 2268

If you are not getting any complaints of edgy audio,
or splatter, it could be that the ALC meter circuit is
just really sensitive. I wouldn't worry too much about
it.

Is there an adjustment on the 530 for ALC full scale?

I know there is on most of the newer rigs.

Hi Bill,
Thanks for the reply. I have a copy of the workshop manual but,
unlike most rigs (as you said), there does not appear to be any
internal pot to set the on-scale ALC level.
Audio is fine - just hope I don,t wreck the meter! I may try putting
an electrolytic cap across the ALC section of the switch to slow
things down a bit.
Cheers,
Rick

This might seem to oblivious, but why don't you just switch the meter switch to a different position after you set the ALC level. It's a mechanical meter and not fast enough to show you accurate voice peaks. If you want accurate audio settings for your rig, get a scope, to monitor the transmitted waveform. That's far more accurate than diddling with a mechanical meter. An electrolytic capacitor across the ALC switch settings will make it even more inaccurate. With my TS-830, ALC control is set to zero, and audio level is monitored by the scope on the transmitted output.

Pete, wa2cwa

On Thu, 02 Sep 2004 02:13:45 -0000 "Rick" <vk7rl@...> writes:
Hi Bill,
Thanks for the reply. I have a copy of the workshop manual but, unlike most rigs (as you said), there does not appear to be any internal pot to set the on-scale ALC level.
Audio is fine - just hope I don,t wreck the meter! I may try putting an electrolytic cap across the ALC section of the switch to slow things down a bit.
Cheers,
Rick

ALC is actually pretty effective as you are looking at
grid overdrive on peaks, which if not taken to
extremes will not greatly increase third order
distortion products (splatter). The ALC circuit is
actually far faster than the meter would indicate; all
the meter is there for is to show you that indeed you
are into drawing grid current.

ALC can also be used as a sort of speech process with
some degree of success; Looking back through the ARRL
technical material on SSB over the years, there have
been several pieces on using the correct time
constants for the ALC circuits to gain a few DB
advantage over the non-processed signal.

I agree with using a scope for best results; however
lacking that, the ALC circuits on the Kenwood hybrid
rigs are quite reliable in helping to avoid excessive
overdrive which can cause problems for our "frequency
neighbors".

You could also use a silicon diode across the meter in the fwd direction, if the meter sensitivity will allow it.

Look for the ALM line, perhaps you can insert a series resistor to limit the current to the meter.

I would not use a cap as it will slow your meter response down.

ALC comes from the circuit that looks for grid current to be flowing in the finals. Could be something wrong there that is allowing too much current to the meter on voice peaks.

If you look at the grid circuit for the PA you will see a rectifier or voltage doubler circuit, such that any grid current at all will generate a negative-going voltage; this is the ALC control voltage.

If you are able to get the same output power on voice peaks as you do on CW/"max smoke tuneup", or slightly more, then the ALC circuit is probably working ok as far as the transmit gain control stage are concerned. If that is the case, then all you want to look at is the metering part and not change anything in the transmitter gain control stages.

Wavetek 3000 service monitor, abt 700 for working one,
lets you fix 2m/450 gear as well.

30 Mhz scope is nice but not necessary.

freq counter, hardly ever used,

Good dvm and temp controlled solder iron, abs
necessary.

RF probe for your DVM is very handy.

I fix most problems with DVM, solder iron, service
monitor (you need a "known" signal source, in
microvolts, to be sure receivers working) and service
manual.

My 520, 820 and 830 all do this, but the audio reports I get are all fine. I just assume it is due to the fact that I have a loud voice :-). It does serve to make me keep the mic gain low, as it should be.

That's the purpose of the ALC meter for sure.

If you can find a monitor scope (the SM-220 or 230
without the band scope option are plentiful), sure can
show you a lot about your sigs.

2278. FS: Very nice Kenwood AT-200 Antenna Tuner

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-09-03 14:16:39 UTC
From: kzerokav
Topic: 2278 Message: 2278

This tuner was designed for the Kenwood 520/820 series radios but
will work with any radio. It is a very well cared for, two owner
unit. Cabinets are a 9/10 and front panel and operation are a 10/10.
It also comes with the original Kenwood factory Operating Manual,
also in excellent condx. $165 shipped/insured in the Conus.

You can use almost any "cheap" scope. Build a "cheap" diode detector from junk box or radio shack parts. Without a scope, you really have no clue how good or clean your signal is. Flea market scopes can start at a $1.00. Using the traditional on the air query "how do I sound now?" doesn't always work.

2284. Re: Grounding antennas ...

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-09-04 03:37:50 UTC
From: pchapman9202003
Topic: 2279 Message: 2284

I may catch a little grief for my answer from others. I am not a grounding wizard, but here is my advice anyway. First answer a few questions for yourself. Are you going to be using multiple antennas? Are you going to be using more than one rig? Do you have an antenna tuner? Bear in mind that what I am telling you will not give you hard core protection. It will only lessen the risk. When lightning get's really PO'd it will go where it wants to. Going on the assumption you are not running a zillion things in shack and need more juice..... If you own your home and can run simple AC circuits, get a 20 amp breaker and use #12 Romex (required by code for 20 amp circuits)and run to your panel. Now you have a dedicated circuit. If your garage door opener, tv, computer, alarm system, etc is sitting on the circuit you are currently using in your shack, you will then lessen the effect of whiplash if they blow out by adding a new circuit. Big time on the computer cuz that can come in from the phone line, DSL, dial up whatever WITHOUT considering the power. It could jump into the circuit. If your ham gear is worth spending $100.00 on, get a UPS. (Get a separate one on another circuit for your computer with a phone line suppressor.) For that $100 amount you spend on your shack gear UPS you can get a nice 700 to 1000 va UPS at your wholesale club with damage reimbursement. (Some UPS units have surge protection for phone lines, but that is only effective to the best degree if you interupt it at the first stop in the house from the network protector. i.e. you might protect one computer and blow up the rest. (If you can't insert at the source get a phone line supressor for each computer if you have an analog line or multipoint dsl breakdown) My DSL comes into the shack and is stopped with protection and then goes back out Ethernet and analog.) Keep receipt for the UPS as though it were gold. Make 10 copies. Send in the warranty slip with pictures of your equipment attached. They will throw them away, but you can afa davit a sworn statement that you did. Tape a copy of the receipt to the UPS with a packing slip stick on. Next get a good grounding bar. Home Depot etc. Copper with usually 5 or 6 ground holes for screw down securing. Run ground wire #6 from the bar to your power/phone line ground rod. Should be one in the same. You may need an extra clamp for the rod, depending on what they left you with. All grounds you run to the ground bar from your rig equipment should be smaller. You want lightning to take the path of least resistnce, not equal or more. Use #8 or #10 from the ham gear. If you are running multiple antennas, get a good antenna switch that has an off/unused position on the switch that defaults to ground. If you are running multiple rigs to one antenna through a switch, do the same, where you have an open position. (They can have some amount of feedback so you may only want to have one at a time powered up)If you are buying an antenna tuner in the

future, add another small layer of protection with multiple antenna positions and leave one open to switch to when not in use. So do I have you protected now? No I do not, I have only lessened your risk. You have to remember that lightning can come in from your power line, your phone line, or even, yes, your antenna. You must protect all. One thing that is an equipment killer is the mini-surge that can originate from your power company or mini interuptions that occur. I.E. Power drops for a few milliseconds without a true down time. A lot of stuff in your house suffers when that happens. Not enough for a reboot, but enough to drive components into a frenzy that might take some time while damage is occuring to cause failures over a period of time from not having the proper reset that they needed. Level out the risk and surges.... UPS everything possible of value. Just remember most UPS have back up power outlets and surge protection outlets. Super juice hungry stuff like laser printers put on the surge side. Keep the ham gear (on a different UPS, if possible)on the continuous power side. It does not draw much power idle but great damage could occur if the power is not filtered and regulated at constant voltage. A good UPS will help eliminate that problem as well as the bolts from the sky, but no guarantees, just reduction in risk. The group moderator Bill, K0ZL may have some comment or critic to my statements if I am incorrect, and Bill, most welcome if you do if I need any corrections. Good luck and hope this ramble was helpful.

Most destructive pulse currents come in on the
grounds, braids, etc on antenna lead-ins so it's real
important to get those grounded just where they come
in the shack, so the current doesn't end up in the
house.

If you ground antennas but leave coax etc hooked to
the rigs, the current will still get 'em.

2287. Re: [TS-520_820_530_830] Cabinet painting 520 series

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-09-05 22:15:01 UTC
From: Mike
Topic: 2275 Message: 2287

I have a TS-520 that was repainted very poorly so I will be attempting to refinish it myself. The paint will be color matched against an original AT-200 and will hopefully have the same finish.

With the amount of paint I will have to purchase I should be able to do about 20 sets of covers. Let me try it out on my own radio before I offer to paint any others, that way if it looks horrible I'm the only one who is out anything.

There used to be someone who sold Kenwood colors in spray cans on eBay, you might check to see if they are still available. Has anyone on the list every tried these?

>Does anyone know of someone who refinishes cabinets? I have a

Be sure to cook your covers at about 200 deg F for 2
hours, or until the paint fumes are gone. This will
give you a rock-hard, very scratch resistant finish.

From: Eric Webner
Topic: 2279 Message: 2289

Do a search on grounds. There are a number of methods available, though not one will guarantee that a lightning strike won't get your equipment. I disconnect leads from rigs during storms.

Beyond that, my best recommendation, in a word, is POLYPHASER. They are the most highly recognized manufacturer of lightning protection equipment.

Eric

Bill K0ZL <coorsbill@...> wrote:
Most destructive pulse currents come in on the
grounds, braids, etc on antenna lead-ins so it's real
important to get those grounded just where they come
in the shack, so the current doesn't end up in the
house.

If you ground antennas but leave coax etc hooked to
the rigs, the current will still get 'em.

I have put the ic-10 kit into the TS-440S ,at the same time as
replacing the lithium battery.
I cant get the pc to control the txcer,I have the if-232 interface.
There is a fault somwhere.
Is there a simple way to test the port on the radio.I not to bothered
if the kenwood interface is bad because I could build a level
converter.
There is a reference to the rs-232 cable in the if-232 manual,normal
and cross wired.Which one should I make up to use with a modern pc
and "ham radio deluxe" software.

Hello group. Name is Dave and just joined the group.
I have a TS-520 with a bad Q3 (3SK41(L)) on the
RF board. Been looking around for a replacement but
have not had any luck finding one yet.
Does anyone know where I can buy one of these critters
?
Has anyone had any luck with the NTE type general
replacement parts like a NTE-222 ? I think I would
like to go with the original part number if I can
get one.

Thanks es 73

The NTE-222 is the recommended replacement. You can
also use the 40673 RCA transistor.

2293. difference TS-520 VS 520s VS 520se

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-09-08 20:27:34 UTC
From: Sean.....He's the cat that won't cop out
Topic: 2293 Message: 2293

Hi all,

It appears the major difference between a 520 and a 520s is the inclusion of 160 meters? What is the difference between a 520s and 520se? If there are any other substantial differences between the 520 and 520s I would be greatful to know what those are as well.

Many thanks in advance,

Sean

From: Brent Baum
Topic: 2293 Message: 2294

Sean,
As the proud owner of an SE model I can offer the followig:
The main differences in the SE model are that:

1. No DC power supply connection, 120v AC operation only
2. Transverter connections and associated switches, etc. were removed
3. Locations on the back panel for some of the sockets, switches, etc. were moved around

Other than the above the SE is basically the same radio. As proof of this, when I opened up my SE I saw that the circuit boards still had all the connection points for the transverter circuitry. Some say that the SE has somewhat better receive sensitivity and perhaps a little better transmitted audio, but those are points of contention with many.

Also note that with the S model Kenwood added the RCA jacks for the DG-5 digital display unit to the back of the radio. The S model has the transverter switch rewired to allow automatic switching between the radio and transverter.

Hope this helps.

The nomenclature is similar to that used by Yaesu during the 70's where the E meant economy. Yaesu's FT101E had an EE=economy and an EX extreme economy models where certain features like 12 volt operation were deleted from the rig. Kenwood di the same thing in order to capture a market where $100 meant the difference in a new rig or keeping the old one.
If you think about what these rigs cost new back then and what people were making, they were very expensive. A Ford was selling for about $2000 and a Lincoln was in the $5000 neighborhood. A brand new FT-101E cost $750 and I think a TS-830 was about $800.

You forgot the following:

1. FIXCH.AVR unit modifications to eliminate the DC-DC converter (-6V)
2. The marker unit has been redesigned to a new circuit
3. Modifications for the introduction of the CW NARROW/WIDE switching function.

Hi,

The 520 had the ch select switch between the meter
and the vfo dial to select fixed crystal 1-4 frequencies.
Meter function switch was coaxial to the load control.

The other models replaced the above with the meter
function switch and did not offer fixed crystal.

2302. TS-820; 820S

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-09-10 03:11:59 UTC
From: emporiaars
Topic: 2302 Message: 2302

Hello All, I've been reading on the 520 differences and suppose that the same goes for the 820 & 820S. Right? What is the need for the DC to DC converter. What is wrong with hooking 12v to the rig. I would liketohavethe 12v capibility for one of my 820's. Just in case the need ever arise. I am looking on e-bay and at local Kansas hamfests too. When I get to looking for a mobil HF rig what is the best bang for the buck. I'm a single parent with, like most everybody I know, a really tight budget. I would like to have an Icom 706 w/ 2&70cm but their out of my price range. Thanks Mike KCØNFG

Topic: 2302 Message: 2303

820S has digital display; 820 didn't.
Need for DC to DC converter: it's kind of hard to convert 12V DC to approx. 800V DC for the 6146 plates without the use of a DC to DC converter. Of course, you could also use a 12V to 120V AC Inverter and just plug the AC plug into it.

Pete, wa2cwa

Unless you need the 2/70 feature and tiny size, go down one step to the 718. I have one. Good bang for bucks. They do go as low as $449 with DSP and full warranty new. If you are doing mobile, go to the battery and no power suply is needed. Then look around for an astron rs 35m with meters to bring it indoors later. Sometimes you can find them $75 to $100. If you have a decent 820 that you can sell, it should bring 200-300 So potentially you could go mobile with WARC and an 8 pound radio for about $150. A lot easier to put in a shock case and throw in the trunk for security when you get out of your car.

Caution! I have been told that using one the dc-to ac invertes, sold at Walmart etc, (so you just plug your rig into it) should not be used to power your rigs. Unless you buy the more expensive SINEWAVE output type, most have a square wave output, which is very hard n your radios transformer.

I dont want to take the chance of ruining my Rigs Xformer, so I bought the Kenwood 12 volt accessory that attaches to the back of the TS-820S rig and rewires the Xfromer for 12VDC. Got it on the Swapnet for 15 dollars!
The transistors used to make one are vry expensive, but the parts themselves are few and it would be easy to homebrew one.

Perhaps someone else can comment on the square wave output of these 12v DC to 120v AC Inverters and if is possible to smooth them out to sinewave performance, or if in fact, it is even required whn used wiht valuable rigs.

Topic: 2306 Message: 2306

Hi all,

Waiting to go back on the air after being away since 1983 or so. My new call just posted on the ULS site, KC9GNA, and I sent in the paper work this morning to claim my old call, WA2LKV. Last week I won a 520s on eBay and I am anxiously awaiting its arrival.

In the meantime, I wanted to start getting my antenna situation in order. Being so out of touch I have no idea where we are in the sunspot cycle and what bands are open. I always preferred 15 and 10 and was going to start building myself a quad BUT....if these bands are currently dead, I will work on something else. Can someone please tell me what is open these days. I have looked on the internet but not seen much info. I hope this is not too off topic...did I say I was waiting on my 520s?

20 and 40 are usually good all the time, I've been as far as New Zealand from the mountains in Utah with my 520SE on a half wave 20 meter dipole 14 feet off the ground. Arm chair copy. 20 and 40 dipoles aren't impossibly long either, about 32 feet for 20 and 64 1/2 feet for 40.

Hope to hear you soon,

73 de K7MEI

Done a stupid thing the other day, switched on the TS-520 and left it to answer the phone, the antenna was plugged into another radio and the 'send' switch was on, now its not transmitting, is it likely that I just need a new pair of 6146's to get it going again or is there a chance I have done more damage. It recieves ok.

many thanks,

John 2EOEWL

Was it in tune mode? if in SSB then there should not have been a signal.
CW the key had to be closed to send.

When you try to xmit can you hear a signal on another radio nearby? If so
this is a good sign. The 12BY7A should have some flourescent purple glow
when xmit also.

I didnt take any notice of what mode it was in at the time, but the meter needle was flickering backwards and forwards to full scale when I got back off the phone. Now when I key the mike there is no sign of transmitting. Now during tune up, occasionally I get full power output, but not very often and nothing when switched to ssb and using the microphone.
Any help is appreciated.

I think it is time to open up the rig and start measuring voltages.
Since you think you were transmitting
for some time, I would check the solder connections at the tube anodes
first. I don□t know if the tubes
can get hot enough to melt this solder but I would check it just the
same. The anode clamps may have
distorted and are no longer making good connection here. I would then
check the plate parasitic chokes
for damage. The ones at the tube anodes. If that checks out then you
will need to start measuring and
checking other components for failure.

1) Was there any smell of burned parts.
2) When you transmit, do you have full plate voltage on the meter.
3) When tuning up and you bang on the rig cover, does this do anything.
4) Do you hear any sizzling when trying to transmit?

There was no smell of burning at all, and there is no sound of sizzling when keying the mike, its just as if the mike wiring is faulty, which it isnt, havent tried banging the radio yet, and when I key up, the metre does nothing, as I said on a previous posting, I did get a full output a couple of times while trying to tune up, but nothing on the keying of the microphone.

thanks again,

John 2E0EWL

Not enough info here to tell.

What is the idling plate current in SSB?

Can you make the idling plate current increase with
the bias control?

Any funny smells?

I think these questions already asked, but I'm a
different doctor.

I suspect that one of the taps melted off the tank
coil.

What band were you on when it happened?

What band did you test it on?

Do you have a dummy load?

Can you test it on another band?

Also with rig unplugged and discharged, carefully
remove the PA cage cover, and check the plate choke.
These will sometimes burn open right at the top.

Thanks for the help and advice to all,
Thing is the station is set up 40 miles away at another house, I was there today but had no time to look deeper into the problem, one thing I should mention is that the radio doesent switch from recieve to transmit when the PTT is keyed, of course it used to work 100% before this mess up. As I say, no smells of burning, no sizzling, push the the mike PTT and its like its not even plugged in.
thanks again,

Maybe the T/R relay has welded in the transmit or receive mode. The T/R relay
coil materials (insulators etc.) could have melted and froze the relay in the
transmit mode physically.

2318. 820s real power output

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-09-14 13:49:06 UTC
From: KABOONA
Topic: 2318 Message: 2318

Hello all, this weekend I got my general ticket and went on to the wonderful world of HF. I played with my 897D for a while and then I decided to pull out the 820S I purchased a couple of months ago and give it an initial test. I followed the tuning procedure described in the manual. Plate current was as the manual said (60ma) When tuning the RF, I initially did not get 2/3 scale deflection on the meter's RF mode but was able to adjust it using the RF knob on the back of the unit. My question is, when transmitting I get about 100W PEP output on SSB using a MFJ SWR/Watt meter. I read the specifications in the manual and it says that the power output is 200W PEP. I visited the Rigpix.com website and it has this radio listed to 100W. What is the correct figure?
By the way, the antenna is a 20m dipole at about 18ft high in an inverted V configuration.
SWR on the meter is around 1.5. My measurements were all made on 20m SSB.
regards,

Jim
KB1KZI

Topic: 2318 Message: 2319

What you have is good. 200w PEP is input to the final stage, not output.
Well done!

From: Ron Kienzle
Topic: 2318 Message: 2320

I'm not a power metering expert by any stretch of the imagination, Jim, but after 46 years of watching watt meters, I've noticed a few things.

First of all, the OUTPUT of your 520 should be between 90 and 110 watts -- nominal output then, is 100. INPUT power to the final tubes is about 200 (plate current x plate voltage) but half of your power is dissipated in heat, light, and other inefficiencies.

Second, it takes a pretty good scientific meter to tell exactly what your output power is. Average, RMS, or PEP are all measured and computed differently. In CW with the key down, your MFJ should show about 100 watts +/- 10% assuming correct calibration. Same with the RF meter on your rig -- calibration is the key.

Finally, sometimes reflected power ADDS to your watt meter reading. So, if you've got about 10 watts reflected your meter could read 10 watts high. A high quality directional wattmeter like a Bird 43 is necessary for really accurate readings.

Sounds like your rig is doing exactly what it should and I wouldn't worry a bit more about it! Enjoy it, get a key, work some DX, win some contests, do some ragchewing!

73,

--Ron (KZ7P)

Subject: [TS-520_820_530_830] 820s real power output

Hello all, this weekend I got my general ticket and went on to the wonderful world of HF. I
played with my 897D for a while and then I decided to pull out the 820S I purchased a
couple of months ago and give it an initial test. I followed the tuning procedure described
in the manual. Plate current was as the manual said (60ma) When tuning the RF, I
initially did not get 2/3
scale deflection on the meter's RF mode but was able to adjust it using the RF knob on the
back of the unit. My question is, when transmitting I get about 100W PEP output on SSB
using a MFJ SWR/Watt meter. I read the specifications in the manual

and it says that the
power output is 200W PEP. I visited the Rigpix.com website and it has
this radio listed to
100W. What is the correct figure?
By the way, the antenna is a 20m dipole at about 18ft high in an
inverted V configuration.
SWR on the meter is around 1.5. My measurements were all made on 20m
SSB.
regards,

Jim

A TS-820 will only put OUT about 100-120 watts,
sometimes less on 10M. The old way of rating rigs was
to rate the plate INPUT power, which is always greater
than the OUTPUT power.

If you see 60 percent efficiency, you are doing very
well.

Thanks to all who responded. It is good to know this rig is working fine. I am having a blast, the other night I even got to receive some pictures (SSTV) and also some psk31. I need to figure out the correct set up so I can transmit as well. It is not as simple with this
rig as with my newer rigs.
By the way, is anyone using the astatic D104 mike with their rig? That is what I have but I get the feeling that this mike might not be appropriate.
One more thing, I have my key on order!!

Hello everyone,

I am a loyal lurker tho haven't
posted for a while hi.
Just picked up a very nice 520 and mc50
at a hamfest this weekend. The rig works
great and appears to have the orginal finals
in it. My question is the serial no. is 520,719
any one hazard a guess as to its age?

The D104 will work fine.

Later on you can get a Heil Prosound mic, which is the
tops for all kenwood rigs.

Keep the D104 for your vintage AM transmitter, when
you get one.

2326. Resistors R7, R8 on Final Unit of TS-830S

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-09-15 05:09:59 UTC
From: k7zs
Topic: 2326 Message: 2326

Just acquired THIRD TS-830S. Why? This was by far the BEST condition, it was local and very affordable.

So, all is terrific except power output is a bit low. About 75 - 90 watts. Have swapped out several sets of both drivers and finals, and get same output with tubes that put out 100+ watts in the other radios.

All voltages are very close to spec. HV is 915v on receive, 800 on xmit. Only real variation is on the 6146B pin 3 I measure only 248v on receive (instead of 264) and about 215 on Transmit (instead of 222). I decided to measure the voltage divider resistors, R7 and R8, that control this voltage (I am pretty sure, anyway!). Measuring across R7 I get 102 ohms, but on R8 I measure 151. These are supposed to be 100 ohms.

So, my questions are:
1. Are these resistors what controls this screen voltage
2. Can a low voltage here reduce power output.
3. Can I get an accurate measurement of the resistors without removing them from the board?
4. Any tips / tricks to easily remove and replace these resistors. I seem to remember that getting the FINAL UNIT out is quite difficult!

Any insights greatly appreciated!

You will find that the D-104 cuts the low end off; not
an issue with most SSB rigs running narrow TX filters.
It's also a good thing for DX and contests.

I had a guy switch between a ceramic and dynamic D-104
head on AM on 75 the other day, on a noisy circuit.
The difference was amazing. Total readibility with the
ceramic, muddy on the dynamic.

2330. 820s and tuner question

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-09-21 09:55:03 UTC
From: KABOONA
Topic: 2330 Message: 2330

Well, so far my 820s is working very well in 20m. I do not even use my 897D in the shack anymore, it is staying in the truck hi hi.
I picked up a mfj tuner, it is the versatuner II mfj-941. I went to the mfj website and found that they have the manual for a mfj-941e which needless to say is different than mine. The one I have is very old, the front face is beige in color and the top is simulated woodgrain. Does anyone, by any chance have the manual for this tuner?
Thanks in advance

From: Brent Baum
Topic: 2330 Message: 2331

MFJ offers a reprint of the manual for $5. I haven't bought one yet for my 941 that is just like yours.

To Calibrate: Antenna output to dummy load, transmitter in send, meter switch to FWD, adjust the 30-300 watt power control for max meter deflection while remaining on scale.
To Tune: Antenna output to dummy load, transmitter in send, meter switch to SWR, adjust "transmitter" knob for minimum deflection of the meter.
Then switch to your antenna and adjust "inductance" and "antenna" knobs for minimum SWR.

This procedure seems to work very well for my TS-520SE into a 20m wire dipole.

Good luck and 73, de K7MEI

Subject: [TS-520_820_530_830] 820s and tuner question

Well, so far my 820s is working very well in 20m. I do not even use
my 897D in the shack anymore, it is staying in the truck hi hi.
I picked up a mfj tuner, it is the versatuner II mfj-941. I went to
the mfj website and found that they have the manual for a mfj-941e
which needless to say is different than mine. The one I have is very
old, the front face is beige in color and the top is simulated
woodgrain. Does anyone, by any chance have the manual for this tuner?
Thanks in advance

Thanks for the information Brent. I did not that MFJ offered that, is it on their website? Also, when you say "meter switch to SWR" or "meter switch to FWD" are you referring to the knob on the front labeled SWR/WATTS? If so, can you tell me which position is fwd (in or out)? I am using an external SWR meter between the radio and the tuner to tune the 20m dipole for now.

thanks in advance.

regards,
Jim

The last I knew you could also go to their website and download the manual. Sometimes the manual will vary slightly as in my case I needed the 962C tunerr but all that was available was the 962D model. Basically the only difference is a roller inductor in one as opposed to an fixed inductance knob. For the most part you should be able to find your unit or a version of it on the web.

Before you get the process going if you do not already have a P-Touch, get one. I use mine for all kinds of things, storage bins etc. But to have those labels on top of my tuner which is a 949 without looking for paperwork saves me a ton of time. My 2 pesedos

Hi all,
Maybe someone here can clear this up for me .... :)

Checking out on Ebay, I see all different models of Fluke digital multimeters ... so now I'm trying to figure out which model to purchase/bid on ..? So what model would you reccomend to do repairs, alignments on Kenwood Hf radios? ... especially the classic tube rigs.

Thanks for your reply,
73, Clint

I was in the land mobile for many years and a dvm is great for trouble shooting, but for an alignment I prefer an analog meter such as the Hewlett Packard 410 as nulls and peaks are a lot easier to read.

Fluke, any of the 70 series (72, 73, 77) are pretty
much bullet proof and quite affordable. I have only
been able to destroy mine by leaving it in a steam
sterlization area, where it got up to 85 deg C and 100
percent condensing humidity. The meter still worked,
but you could just barely read the display.

2338. Power Problem on TS-530s

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-09-24 19:44:36 UTC
From: bobo19472002
Topic: 2338 Message: 2338

I purchased a TS-530S & determined that the bandswitch coupling was broken. I replaced the coupling & riented the back switch with a flat to the bottom and other to the right side of the radio. Then when the knob is on 10 MHz (not 10m) the two flats should be vertical on the front part.

I now have power output on all band above 10MHZ, but the plate dips at a different point on the markings on the dial, usually higher. Example:

14 dips just before 21MHZ, 21 dips just about 28MHZ, 28 dips past the markings for 28MHZ
7 MHZ disp around 10MHZ as well does 3.5MHZ.

I am unable to get 1.8 to dip at all & power output on 1.8, 3.5 & 7 MHZ are low. I enable the WARC band & the output is similar to that of 14 & 21 MHZ, just that the plate does not dip as the marking show.

I purchased this radio for by brother in law who has cancer & now that he has upgraded to a General license, I need to get it fixed.

Any help would be appreciated!

Bob

Perhaps someone can help you more than I, but when the coupler broke on my 830, I had to just experiment, band-by-band, to get the shaft back in the proper orientation. There might be some other way to do it--I'm just saying, it is possible to do it experimentally.

Bob, without a grid dip meter, this will be a
difficult task of carefully tracing the tank circuit
wiring to the band switch, understanding how the tank
coil and padder capacitors are switched in for
different bands and so forth, and then lining
everything up.

2344. TS-820S needs help!

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-09-28 01:37:24 UTC
From: Al Mikkelsen
Topic: 2344 Message: 2344

The main problem is when keying the mic the unit goes silent but it will come back in less than 30 to 40 sec. It receves just fine!
TS-820S It has some problems I hope some of you will have some input on how I may get it up and running!
Historical information Kenwood TS 820S - late 60's early 70's ..????? 2nd owner purchased unit in late 1992 with VFO and MC-50 Mic. The above-noe a SK-had paperwork suggesting that two mods MAY have been added..!!
TS-820 Rcvr Mod kit (by W6TOG)
"Magicom" RF Processor Module
About four years ago the SK began haveing problems- it was believed he was unable to yune for SSB or CW, and ultimately the radio sat in a cold and moist envirnoment for the next three years.
When I got the radio it had began to 'rust' on the oyter upper surfaces of
the case, four of the five 'flip' switches broken or missing, and some of knobs loose.. the cable for the VFO was missing = as was the 9 PMT Plug necessary to utilize the internal VFO. Surprisingly, the internal metal surfaces were relatively clean/clear of debris.
The finals appeared to be a matched set of S2001A's and the heater tube 12BY7A also appeared to be 'Japanese originals.. The Heater tube appear to be 'gassy'..?
Startup:????
It was plugged into 110 and turned on - left for perhaps a full day - and antenna hooked up that evening.. Lacking a 9 PMT, the 8 and 9 pins were 'jumped' and reception was immediate and good quality.
However-any interruption of the incoming signal with the function switch to
VFO R or FIX - FIX, or using the SEND/REC switch result in a prolonged 3-to as much 20 seconds delay with the signal coming back 'squeaky' or tortured
like a noise working itsway through a maze- getting slightly louder until it returns to the original strength..!!
The heater tube was replaced and used working finals installed and tube bias
adjusted as per manual.. Unable to perform any further transmitter tuning as
per instruction manual.
Continue to be plagued with the interruption of signal as described above when the mike is plugged in and PTT pressed.. Acts the same as when using the
send/rec flip switch..
I confess to being unfamiliar with the radio and unable to tune it according
to the manual.
Mave "LPS'd various switches and dials and molex fittings without any

appreciable change.
HELP!!

Sounds like the T/R relay is dirty or worn out. If it is an Omron, most likely the original. There are a few plug and play replacements available. Problem usually worse when rig gets warmed up. Clean the contacts with paper or good contact cleaner if you can find. That should identify the problem if it gets better, at least for a while.

Charlie,
You never said what happened to the rig. How about all those accessories in the picture? If the insurance is covering your home then it should cover the equipment.

73,
Norm, W3IZ

There is a can for auction on eBay right now:

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&category=4671&item=5722368438&
rd=1&ssPageName=WDVW

I've never tried these but the comments in his feedback ratings seem
positive. For the low price I might give this a shot in the near future,
it certainly can't make my cabinet look any worse than it does now.

Nonsense, if you are brave enough, shop eBay. I just recently won a 520S for $197. It should arrive today actually....Good for you....and bad for me, since winning my 520S, I have seen 520S finish for as little as $150 bucks. You still have to factor in shipping and hope you don't get ripped off but I think if the seller is a ham you are pretty safe though.

There a lots of good radios of this vintage for good prices. If you are not married to the 520 series, I have also seen great deals on 820s and also Yeasu 101Es.

Best regards,

Sean - KC9GNA

2356. TS-820S receiver audio noise with AF Gain all the way off

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-09-28 19:53:18 UTC
From: dimitri@dotp.com
Topic: 2356 Message: 2356

With the AF gain at minimum there is some barely audible hiss AND some sort of crackling noise (sounds like QRM on 160M :)).You have to be very close to the speaker to hear it

Both of these get completely covered up as soon as the AF gain is increased by the band noise.

However...i'd like to get rid of the crackling noise - provided I figure out what causes it :)

I was wondering if anyone else has encountered this problem.

Topic: 2356 Message: 2357

Sounds like a noisy resistor or transistor or a leaking capacitor in the circuitry that is between the audio volume control and the speaker output. A scope could probably find it quickly. It will only get worse.

Pete, wa2cwa

Sounds like bad coupling cap in the audio amp; I would
change the one just after the audio amp IC, should be
fairly large value, at low voltage.

2359. Previously Dead TS-520 - WWV Button Oddness

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-09-29 14:38:11 UTC
From: Jason Creager
Topic: 2359 Message: 2359

Hi everyone,

Well, I finally decided to get serious about my TS-520 and figure out what was wrong with it. Actually, this was a couple of weeks agao and I was just putting it back together so that I wouldn't lose any pieces since I'd been over every square inch of exposed circuitry with a magnifying glass looking for (and not finding) anything blown.

Lo and behold, the Screen Grid switch was off. It probably happened when I was moving things around and something on my messy desk bumped it. I also found a small piece of styrofoam peanut that had escaped into the black transistor cage on the back that could account for the hot smell. I hurriedly hooked everything up again and could hear signals! I couldn't tune anything primarily because my compromise mounted G5RV antenna is so damned noisy that I often find myself turning off the FT-897 (even with some DSP) and going inside to do something less frustrating.

So, it's nice to know that it works and isn't dead as previously reported.

One odd thing that perhaps you folks can help me track down. When I hit the WWV switch, the audio seemed to zoom up, then stop. It kind of reminded me of listening to the "capacitor filling up" experiment from my old Radio Shack 50-in-1 Solar Electronics experimenter kit. Any ideas there? I'm getting it ready to sell and want to have it in perfect condition.

Thanks,
- Jason - KC0ERG

From: dimitri@dotp.com
Topic: 2356 Message: 2361

The output cap was in my list of "immediate suspects". However it made no difference as far as the crackling sound goes.
I did find the same noise present on pin 4 of the Audio amp chip. The value is 47pf in the PC placement diagram and 330pf in the schematic right above it (C25 AF-AVR board).
I replaced it with a 22nf "just to see" and the crackling was eliminated as well as what little high frequencies pass through and of course at the same time the gain of the audio stage was reduced considerably.

I don't like the idea of having the AF gain control at 11 o'clock for "normal" volume level so I removed the 22nF cap and doing nothing about it for now :)

I tried to find a data sheet for the TA7201P to get an idea of what pin 4 is/does and what the function of the cap there is so I might experiment with other values but had no good luck finding it.

I broke one of the tabs off on one of mine, but I lost it. I managed to get in back on without taking the cover off and it is working ok. If you can live without it for a short time, hopefully someone can reccomend a good cement to use on it, Bill or one of the other whiz kids here that have probably done that before. As many times as I have seen this kind of post, I should hope there would be a source.

Krylon "Satin Stone Gray" is very close. I resprayed an 830s using
one
of their aerosols some time ago. Was able to achieve/retain the
textured effect by spraying in small bursts and allowing it to dry
between applications.

No, Jim, slightly different IF center frequencies.

I would get the Inrad filter; much better sounding
anyway.

Topic: 2375 Message: 2375

Can anyone please explain to me, better than the manual, what the point of the tune mode VS. the CW mode. I understand the relationship and use of the tune mode when tuning up the radio but as far as operating the radio I am confused as all heck. The manual says in CW mode the straight up pointer notch is your frequency but then you should switch to tune mode and zero beat something else and that is your receive frequency??!!! I understand this concept when operating a seperate XMTR and RCVR but what is the point of this with a tranceiver? I though the freqency you were transmitting on was the frequency you would receive on also...No? Please someone straighten me out.

Also I am talking about one VFO, no splits or anything like that, just simple HF CW operation.

Many thanks in advance!

Sean - KC9GNA

2376. RE: [TS-520_820_530_830] 520 Mode confusion

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-10-01 18:30:00 UTC
From: Ron Kienzle
Topic: 2375 Message: 2376

I'm probably not going to explain this real well, but it will give you a start. In CW receive, the actual frequency you are receiving is offset from dead zero beat -- maybe 750 Hz. That's what gives you the tone, otherwise you wouldn't hear anything (although I've been known to copy CW at zero beat because it quiets the background noise). When you transmit, your transmit frequency is 750 Hz below what you are listening to (or dead zero beat) -- the other guy's receive is offset, too. In tune mode, the offset is disabled.

I think that's close to right.

Most rigs with digital readouts automatically adjust for the offset and show receive and transmit frequency as the same.

73,

2377. CW Filter for the TS-530SP

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-10-01 18:25:11 UTC
From: Richard Harris
Topic: 2377 Message: 2377

The subject of CW filters for the TS-830 arose today so I thought it might be timely to answer the same question about the -C1 filters for the TS-530SP. I bought a TS-530SP recently and have installed a CW filter.

The Kenwood Manual specifies the YK-88-C filter. In the UK at least, these are hard to come by. There are YK-88-C1 filters available, both second-hand from dealers (at the UK equivalent of about US$70) and occasionally on Ebay. Like the TS-830, the -C1 and the narrower CN1 have filter blocks fitted to a small circuit board with connectors at each end. These filters are available second-hand because they have probably been removed from rigs before sale - the absence of a CW filter may not affect the second-hand price of the transceiver - and then sold separately to maximise the proceeds.

These filter boards are fitted with the same crystal filter block as used in the TS-530SP, so it is just a case of unsoldering the filter from the -C1 circuit board, gaining access to the top and bottom of the IF Unit in the transceiver and soldering it in place. The operating manual covers this. I found that I had to unplug most of the connectors to the IF Unit but there is little chance of plugging them in wrongly when the time comes to put it all back together.

I bought the YK-88-C1 filter second-hand from a dealer in the UK. It works very well and I consider that it was money very well spent. I use the variable IF to peak the filter at the audio frequency that I prefer for CW.

TUNE mode in transmit lowers your screen voltage to a
safe level, so you are less likely to damage your
tubes if the tank circuit is out of resonance for too
long.

TUNE mode in RECEIVE allows you to ZERO BEAT a CW
signal by going for... well, zero beat (lower tone,
lower, l-o-w-e-r, then zero). Then when you flop back
to CW mode and start transmitting you should be right
on top of the other guy's freq.

I never use that for tuning on rx on cw mode; instead,
I just set the other guy so that his sig has the same
pitch as my sidetone when I tap the key. Close enuf
for gov't work...

Hmm that is interesting... Take a look at the
oscillator coil for the 15meg (wwv) band... may need a
little tweak to keep the xtal happy.

OK on the SG switch, that is also known as the
"grandkids switch".. to save the rig if it gets put
into tx mode by curious fingers...

2387. TV-506 connecting cables

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-10-02 15:38:56 UTC
From: emporiaars
Topic: 2387 Message: 2387

Hello, I bought a TV-506 from KG6TTE in California. He just had it pinned to his rig. I was wondering where I might get the connectors and wire for the jumper? Thus I will be able to use the TS-820S that is just setting there. Still working on element 1 and 3. It takes a while for water to soak into cement! I will prevail! Any recomendations on antenna for six meter, wire or other. I am open to any and all suggestions. I work in machine shop and have access to the equipment. I do tig weld, so a beam is not out of the question. Is there any known quirks that I will run into? Thank you, Mike
KCØNFG 73

2388. 520 Mode confusion - continued

Topic: 2388 Message: 2388

Thanks to both Ron - KZ7P and Bill - K0ZL for their explanations. Please can you fellows elaborate just a but more. Say I am tuning on the band looking for a CW QSO. For general receiving do I keep the rig in TUNE mode? Then when I hear a station I like, I zero beat the signal and then switch to CW mode to transmit? Is this correct? My transmit signal would be right on with the other station, no? Then when I done transmitting, do I keep my rig in CW mode and I will hear the station because he/she will be offset by the 700 hertz or so difference between the modes? I guess I could go expirement but I would prefer not to muddy the airwaves with my expirementation. Please bare with me, I never used a tranceiver before.

TRIVIA: After more than 20 years off the air and my ticket expiring, one month ago passed elements 1 and 2. I became KC9GNA.

This past Thursday, my 502s came in the mail, Friday my vanity call became active so I reclaimed my old call WA2LKV, I took off work and built my 20 meter vertical on Friday as well. Today (Saturday), I just got back from passing my General exam and am hoping to run out to get a key and antenna tuner to go back on the air for first time since 1983....oh yeah, I was a life long novice operator before today. This is probably not terribly thrilling to y'all but I am very excited, thus the life story.

Thanks again gang,

Sean - WA2LKV

Sean
I like your 'return' to ham radio. Nothing boring about that...I'm doing the same thing after a hiatus of nearly 20 years. I had gotten all the superior tickets then. In Canada there are only two tickets or levels. But mind you I am like a beginner again....my cw and operating procedures are quite rusty.
If I remeber right you tune the rig to hear the other station to about the same audio frequency as the audio sidetone frequency of your rig. The Kenwoods are around 700 hertz if I'm not mistaken If you 0 beat the other guy he won't hear you 'cause you are 0 beat on him. So its easy: just tune and when his cw is pleasent and 'normal' just start transmitting!
Anyone......If I'm wrong , please say so. Like I said this was 20 years ago
Peter

2390. Re: [TS-520_820_530_830] 520 Mode confusion - continued

Sean,

I think it is great, what you have done.

I would not use the TUNE mode to tune in CW stations,
then switching to CW... etc... just too much work.

The idea of a transceiver is to tune them in one step
and hit them fast to get that rare one.. or whatever.

You will get used to the tone or pitch of your CW
sidetone, just tap the key for a short bit and
memorize it, then tune about until the other guy is
about the same pitch.

They will not always complain if you are too far off.

Best bet is to get someone on the fone to listen to
you as you answer their call, then tell you if you are
zero beat or thereabouts with them.

Don't worry about your novice accent, just get on
there and have fun.

Sean:

I have had a TS820S since 1979 and operated it as a primary rig for 22 years. It is similar in nature to the 520 and of the same vintage, so when I speak from my experience with the 820S, I would assume that it would apply to the 520 as well.

The "TUN" mode is used to tune the transmitter side of the tranceiver. In that mode, the keying circuit does not work and the drive power to the finals is reduced to protect them from over current while the final tank circuit is tuned to resonance. I don't know if the same filtering is applied in receive as is for CW, but since, if you were careful, you could tune the finals using CW, all else is probably the same. Therefore, I would assume that it probably is and that the receiver probably sounds the same as for CW. But I never operated my rig that way.

If you don't have the operating manual for the rig, I would suggest that you visit _www.mods.dk_ (http://www.mods.dk) and see if they have one available for download -- it's free and there is a wonderful load of info on that site.

Good luck, and welcome back to the ham bands.

Welcome back to ham radio, Sean. I hope you are having a lot of fun.

As a practical matter, Bill's procedure is best -- with your 520 in CW mode, receiving CW and you want to zero beat a station, just turn the dial until his carrier is the same tone as your sidetone. I forget how the 520 works but, with the vox turned off and the T/R switch down, can't you hear your sidetown when you press the key but you're still receiving and no transmission occurs? If so, just tune so the two tones, his and your sidetone are identical. You won't be more than 50 or 100 Hz off -- close enough. If it doesn't work that way, you can guess close enough.

See, both your BFO and your sidetone should be about the same offset from dead center -- probably about 750 Hz.

Hope that helps. It's really very easy.

73,

--Ron (KZ7P)

2394. Microphone help needed.

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-10-02 21:00:53 UTC
From: John Shadle
Topic: 2394 Message: 2394

I have a TS-520 which came with no microphone. I have a couple of old swap-meet mikes whose plugs fit the TS-520, but they have no matching transformers inside. The TS-520 manual is adamant about having a mike with a 50K impedance.

Does anyone have any ideas? Help will be much appreciated.

John

all you need is to be within about 250 hz of the guy
calling CQ... that gets you inside most of the narrow
filter bandpasses.

When I call CQ I usually keep my RIT on, and then
sweep it around looking for guys... esp on the QRP
freqs, some of those rigs have wierd offsets.

Rat Shack used to sell those things, blister pack
transformer, coupla bucks... if they don't have them,
come back, we will find you one.

Are you kidding? We are thrilled to have you back, and nothing is boring about it. There is more help than you have had from many years ago, with the exception of the good old one on one which is getting harder to come by. K0ZL runs the best ham forums, period. He lets us have fun but will slap us when we get out of line, which we usually deserve. We need more folks to come back to set example to the newbies.

I have been back to HF less than 2 years after 15 off, but I have had as much fun as I did forty years ago when I got my general ticket. I just have to ask a lot of questions about things I used to know easily.

Shure made quite a few high impedance mikes from a good while back, which, if they did not belong to smokers are still kicking well today. One which was not pretty was the Shure 444D model that had a hi-low imp switch. I have talked to quite a few of them on 820's, and they still sound good, very good. I have also heard of them being had for 5-10 bucks. I have the old shure 444 no designation which works fine on my 820. A little tricky to wire with the ground split etc you have to create. But it still cooks, after 35 years. Ugly, but works great! Bill mentioned Rat Shack. I have seen, but do not have the URL hooks on some pretty exotic stuff people have built, headsets, booms, you name it using specific model stuff, but cheap. (They also have crap too, I have read!)that they swear works better than anything Heil has. Used Kenwood mikes in general that I have seen, even pretty old, seem to carry a high price tag, very high!!!!
Good luck. Hope you have enough luxury of time to get the best bang for the buck. If you have issues with the wiring, I think I have it in an old PC if you do not have the manual

Thanks Paul.

The groups pretty much run themselves... good bunch of
people! Very little intervention needed.

Thanks to the group also.

73,

Bill K0ZL

2400. TS-830S: filter caps going?

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-10-03 15:18:57 UTC
From: Alan Wolke
Topic: 2400 Message: 2400

Hello All,

My TS-830S has recently begun to develop a small problem, which I think may be the HV doubler caps starting to go. Audio reports that I've been getting have indicated that I've got a little distortion. Recordings that I have heard sound similar to the effect that you hear when speaking through a fan (slight choppy, modulated audio). It makes me think that maybe I've got a little 120Hz on the HV supply.

I also took a look at the CW envelope on my SM-220 scope, and I can see a small amount of ripple that may be 120Hz (I'll have to do a quick freq cal to check it).

Given this description, would you agree that the HV caps are suspect, or should I look elsewhere. I nearly sure these caps are original.

Anyone know of a good replacement source for these caps? Or have a good set laying around?

Thanks and 73,
Alan

Yep, time to change them.

I get mine from Digikey, will give you the number when
I get to the shop tomorrow.

"when speaking through a fan" Is that similar to "talk to the hand"? Poke a scope in the power supply section and take a look at the waveforms. See what kind of AC ripple you get there when you modulated the rig. Check to see if the caps are very warm to the touch, have strange bubbles forming on them or are starting to leak "stuff". All good clues that they should be replaced.

You going next week??
Pete, wa2cwa

Hi Pete,

Yep, that's what I planned to do next (probe the supply), once I get a chance to un-bury the rig from the shack bench. Under full power CW, where the HV supply is taxed the most - I wonder how much ripple is typical/acceptable?

I do plan on going to the Packrats hamfest next week. In fact, there should be a bunch of us there (including George N3GH, Ron N2NGY, John KF2JG, Tom AG4QP and maybe even Levent WW2L). Ron and John are planning on coming here, and the three of us will drive down together. Hopefully the wx will cooperate - see you there!

73,
Alan

Using DVM on AC range, make sure it can handle
1000v...

you should see no more than 2v p-p or about 1v rms
when in transmit, idle current SSB of 60mA

What does your plate voltage read in transmit mode?
Should be over 800v.

When one of the caps fail, it will drop to 400-450
volts, and you will get hummmmm but no blown fuse.

2406. For Sale: Kenwood MC-50 Microhpone

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-10-03 21:09:45 UTC
From: kzerokav
Topic: 2406 Message: 2406

This beautiful MC-50 appears to have NEVER been used. It is in the original box (and packaging) with the original instruction manual (not the sheet that you usually see)and the factory warranty card and warranty, never sent in. The PTT bars are lilly white. It is the original 4 pin connector. It is definitely in collector condition. $75 + shipping.

The last of the Kenwood 520 era, this is a two owner radio in excellent condition inside and out. 160M thru 10M...125W key down on 75M, very slightly less on the higher bands. Beautiful RX/TX audio and great on CW. Everything works as designed, VFO and all knobs work smoothly, all lights are operational. It has been well cared for and would make an excellent back-up radio or even a primary unit. Instruction manual and Service manual included as well as the original warranty card, never sent in. :-) $250 + shipping.

From: Sean.....He's the cat that won't cop out
Topic: 2388 Message: 2408

Once I get all the pieces of my station assembled I will take you up on that offer. Has there ever been a net from this group?

BTW, another question...2 actually if I can be so bold. My S meter shows no movement when my AGC is set to off. It seems to work fine with the AGC set to fast or slow but does nothing when set to slow. Does anyone know if this means more than the meter is screwed up or needs calibration???

Also does anyone have a YG-3395C CW filter they want to sell?

Thanks,

Sean WA2LKV

On my 530, the s-meter doesn't work either when AGC is off. My manual doesn't say anything about that so I don't know whether it's supposed to turn off or not.

Subject: Re: [TS-520_820_530_830] 520 Mode confusion - continued

Once I get all the pieces of my station assembled I will take you up on that
offer. Has there ever been a net from this group?

BTW, another question...2 actually if I can be so bold. My S meter shows no
movement when my AGC is set to off. It seems to work fine with the AGC set to fast or slow but does nothing when set to slow. Does anyone know if this
means more than the meter is screwed up or needs calibration???

Also does anyone have a YG-3395C CW filter they want to sell?

Thanks,

Sean WA2LKV

2412. Aprox. price for a VFO-820

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-10-04 00:44:51 UTC
From: José Pedro Alvarez
Topic: 2412 Message: 2412

Hello all,

I've been thinking on selling a VFO-820, can someone suggest a ballpark asking price for one in good condition, but a modified connector cable (only has connector on radio side, VFO has been internally connected).

The last of the Kenwood 520 era, this is a two owner radio in excellent condition inside and out. 160M thru 10M...125W key down on 75M, very slightly less on the higher bands. Beautiful RX/TX audio and great on CW. Includes the YG-3395C optional CW filter. Everything works as designed, VFO and all knobs work smoothly, all lights are operational. It has been well cared for and would make an excellent back-up radio or a primary unit. Instruction manual and Service manual included as well as the original warranty card, never sent in. :-) $250 + shipping.

It would really be cool to find plans to build a digital display
with old time technology rather than something from AADE...I'm going
to have to go that route. I love my 520 but I hate trying to
calculate my frequency.

2418. New member TS-520 (with TX problem)

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-10-04 03:10:06 UTC
From: Charles Kaross
Topic: 2418 Message: 2418

Hello everyone,
I just joined this group on Friday so let me introduce myself.

I have had a long time interest in radio, electronics, SWL etc.
This spring I finally got my Tech license (shortly after my 50th
birthday) and am hoping to have my General by the end of the year.

To motivate me during code practice, I recently purchased a TS-520
on eBay and have been listening to it for the past week.

My neighbor Bob two doors up has his Extra ticket and I've been
looking forward to having him check out the rig using his three-
element beam. Just got back from doing so and the apparently the rig
has a transmit problem.

Using the tune up procedure from the KG6HAF web site, here's what
was observed:

The idling plate current was 55 ma so we tweaked it up to 60 ma
using the bias control.

The HV in xmit reads 860V - seems a little high.

With the rig in Tune mode and the meter switched to ALC, the meter
reads 0 in xmit and the carrier control does not cause the reading
to increase.

When you key the mic, you can hear the T-R relay actuate - flipping
the front panel switch to send does not cause the relay to pull in
but I believe this is normal.

Checked to see that the back panel screen switch was "On".

Hoping that someone can point me in the right direction in getting
this sorted out -- this actually seems like a rig that the average
guy might have a chance of fixing.

Thanks and 73
Charles Kaross

4,000,900 members will post you on this one. The S meter IS the agc control voltage... so if AGC is off, so is the S meter.

By the way... experiment with turning AGC off, and then reducing RF gain on a QSO.. CW probably most effective for the illustration... Notice that now, you can HEAR THE QSB... agc defeats that little bit of natural input that we can learn to enjoy.

What are the REAL conditions out there? How fast and how deep is the fade? Well, turn off AGC, then reduce RF gain until you get no distortion on the sigs.. Quite a bit of reduction may be needed. Do this on 20M in the late afternoon, into the evening. It will blow your mind how much ionospheric information you have been missing.

73,

Bill

In every rig I have had, the S-meter did not function with AGC off, as it meters AGC action.

2424. Re: [TS-520_820_530_830] New member TS-520 (with TX problem)

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-10-04 13:33:25 UTC
From: Bill K0ZL
Topic: 2418 Message: 2424

Failure to achieve ALC reading in TUNE or CW mode,
with carrier control UP and rotating the PRESELECT or
DRIVE TUNE knob (forget which it is on your rig),
indicates either need for RF deck alignment and/or a
new driver tube.

If you see ALC on ANY band, see if ALC drops off
rapidly after coming up in TX/tune modes; If so,
replace the driver tube.

How much power out are you getting on CW mode into a
dummy load? 20M best band to check. Then check on 10M
and report.

Does your plate current go above 220mA on CW mode,
with max power output? If not, continue...

Does the plate current dip about 10-15 percent, when
tuned for max power output? If not, check next step:

Does the plate current dip coincide with max power
output? If not, neutralize.

Temporarily increase your idling plate current from
60mA to max. In SSB, key the rig, and observe plate
current for 3 seconds only. Does the plate current
come up and pretty much stay up, or does it drop off
rapidly after coming up at first? Bad finals.

From: Brent Baum
Topic: 2387 Message: 2425

Good question, Mike. I've been looking for the connectors, cables, etc. as well and have come to the conclusion that I'm either going to just pin the cable or manufacture my own. The connector is actually made by Hirose in Japan, but they're not readily available here in the States. Good luck.
K7MEI, Brent

Subject: [TS-520_820_530_830] TV-506 connecting cables

Hello, I bought a TV-506 from KG6TTE in California. He just had it pinned to his rig. I was wondering where I might get the connectors and wire for the jumper? Thus I will be able to use the TS-820S that is just setting there. Still working on element 1 and 3. It takes a while for water to soak into cement! I will prevail! Any recomendations on antenna for six meter, wire or other. I am open to any and all suggestions. I work in machine shop and have access to the equipment. I do tig weld, so a beam is not out of the question. Is there any known quirks that I will run into? Thank you, Mike

2427. S-meter & tuning

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-10-04 17:27:19 UTC
From: pjcoombs@frontiernet.net
Topic: 2427 Message: 2427

Hi fellow Kenwood owners,

It seems that from time to time a question of tuning arises, so I thought I would offer the method I have used with good success. It may vary some from the manual, and with Bill's procedure, but the result is the same.

1. Let the rig warm up for 5 minutes or so.

2. SEND/REC to REC, Mode to TUNE, Meter to ALC, center the LOAD and DRIVE controls, CARRIER to minimum, and set the PLATE control to the center of the respective band.

3. SEND/REC to SEND, Bring the CAR control up until the ALC reads about half scale. If there is no movement of ALC, set the CAR at 4 or 5 and then rotate the DRIVE until there is indication of ALC. Once you get some ALC, peak the meter with the DRIVE control.

4. Once the peak ALC is achieved, back off the CAR until the meter is about half scale. Now, still in TUNE and ALC, use the PLATE control to dip the meter. Also dip the meter with the LOAD control. You will find that PLATE and LOAD work together, i.e. setting the LOAD a bit off from maximum dip will cause the PLATE control to reach minimum at a slightly different point. SEND/REC to REC.

5. Mode to CW, Meter to IP, Back down the CAR to 1 or 2. SEND/REC to SEND, Keying the transmitter for a few seconds at a time, adjust the CAR control so that there is about 100 mA on the meter. Check the PLATE tuning, it should be very close. Meter to RF, use SMALL changes of the PLATE and LOAD controls together to obtain maximum meter deflection. Bring the CAR up to the desired output level, or if USB/LSB, return the Meter to ALC and adjust MIC[Processor] for meter deflection within the proper range.

I know this sounds like a lot to do, but it actually goes pretty quickly, and the Plates get tuned with a minimum amount of current.

It is not my intention to pass along bad information, so if you can see an error with this method please post a response.

As for the S-meter, I believe it operates from the AGC voltage, so if the AGC is turned off there should be no S-meter indication. That's how my 820S works.

73, jay kb9wwq

Hi Charles,
I to just got back into redio last fall after being out of it for 50 years in
1953 took my novice test and passed it with no problem had a QRP transmitter
and worked many station CW and then Girls and CARS got in the way and I put
it on the back burner for many years but thought about it many times. I was
incuraged to study and take the test by several hams that would come into
Radio Shack where I worked part time. So I did and I am KE7ALG
Good luck 73's

2429. New TS-520S works well, and a question

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-10-04 18:48:53 UTC
From: Jack Twilley
Topic: 2429 Message: 2429

I bought a new radio on eBay and it works well. Tunes up nicely on all bands for which I have antennas, and I made 62 contacts during the California QSO Party. I'm looking forward to working on installing new antennas that can handle 160m. I still haven't heard anyone on 10m, but I'm blaming sunspots. Are there any frequencies I should check at any particular times of day to see about activity on this band?

Jack.

Huh. I operate like this normally, because I don't like the way the AGC
makes fading sound. Doesn't everyone do this? :-)

FWIW, I heard a fair amount of California guys working the contest on 10 meter CW on Saturday afternoon. I was also playing with my "new" 520s that came on Thursday. It was also an Ebay purchase. I heard plenty of QSO party guys on all bands but 160. I am in Chicagoland and I heard the Cali guys loud and clear on 80 through 10...listening with a vertical designed for 20 meters.

28.200, wide bandwidth, listen for the CW beacons.

28.400, middle of fone band, seems like that's a CQ
freq when guys are checking the band.

Also if you here an occasional "ssccchhwwooop", that
would be a composition board heater and usually
indicates a band opening.

John,

Years ago, I spent quite a bit of time screwing around with transformers to match my Astatic D-104 to the 50k Kenwood mic input. Met with much distortion, etc.

Finally, I hooked the mike up directly to the radio and wa-la! Beautiful audio! Try it that way first.

(I can't remember the impedance of the crystal element in the D-104, so I don't know if your "swap meet" mike will give different results.)

Common practice to run the S-meter off of AGC voltage.

Paul Manuel <k4pdm@...> wrote:

--- Ron Kienzle <ron@...> wrote:
> On my 530, the s-meter doesn't work either when AGC is off. My manual

In every rig I have had, the S-meter did not function with AGC off, as it
meters AGC action.

2438. RE: [TS-520_820_530_830] Re: 820s real power output

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-10-05 02:57:27 UTC
From: Eric Webner
Topic: 2318 Message: 2438

I've been told that the D-104 (ceramic element) sounds great, though a bit "tinny." Years ago, I bought the Heil HC-4 mike element and installed that in the D-104 head. My good audio got even better!

Eric KA8FAN

You will find that the D-104 cuts the low end off; not
an issue with most SSB rigs running narrow TX filters.
It's also a good thing for DX and contests.

I had a guy switch between a ceramic and dynamic D-104
head on AM on 75 the other day, on a noisy circuit.
The difference was amazing. Total readibility with the
ceramic, muddy on the dynamic.

2439. RE: [TS-520_820_530_830] Re: 820s real power output--different mics

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-10-05 03:13:32 UTC
From: donii@sympatico.ca
Topic: 2439 Message: 2439

Guys
Ceramic and crystal mics were cheap and all hi-z (50k to 1meg. sometimes)
They had no lows and not linear at all. Very, very tinny but will work
with old rigs.
In those days one would always wish for a 'dynamic' or moving coil
magnetic mike (lower Z)that required a transformer and often a
preamplifier. Same problem with record cartridge pickup units. You know
about 100 years ago audio records were black (not silver) and you were
required to put a needle on the spinning record and 'scratch' it with a
pickup arm to read the analogue encoding! Ceraimc and crystal pickup
cartdriges were cheap while the dynamic ones were 'Hi Fi' but had lower
impedence.
Actually most crystal or ceramic mics have desiable characteristics for
voice communication. Except that they are not made anymore. Now we have
modern mics, dynamic and condensor, with much better all around
frequency response.
So maybe in this case: Newer is not always better.

That cheap "plywood" used in construction; the wood
chips are glued together, then pressed in an
RF-powered heater, runs right from about 25 megs up
through 6M when they are operating.

2442. dial lamps

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-10-05 14:27:00 UTC
From: Sean.....He's the cat that won't cop out
Topic: 2442 Message: 2442

In a 520 series rig, does anyone know how you get at the bulbs that illuminate the frequency dial? There seems to be no easy way to get at them. Is there a trick or prescribed method for accessing these things? They are tucked under the mounting bracked for the VFO assembly. It appears to me that you have to either lift out the VFO or pull the face off the radio. There must be an easier way. Does anyone know the sercret? Please advise.

Thanks,

Sean WA2LKV

P.S. I am still looking for a CW filter if anyone has one to sell.

Hi Bill,

"Plywood," as in OSB and similar products. Correct?

Eric

The D-104 is commonly considered best for AM
operation, possibly because most of the vintage AM
rigs have so much high-end rolloff (except my Valiant,
and many others that you can hear on the air these
days) that the '104 compensated for that.

The 10DA (bullet shape) head was oft recommended for
SSB usage.

The heil elements are great, if you can get them.

Easiest way is to remove the VFO, which is tricky.
Haven't done one in a while.

the 530 and 830 vfo comes out thru the front of the
rig!

Don't know what OSB is, but if it's that chippy-lookin
stuff they make houses out of these days, that's it.

There are other RF heated products out there, but the
plywood presses are the most prevalent and most
powerful I think. 40-60kW...

GREAT!

That is very good news.

I think what Bill alluded to is that Heil no longer allows the sale of their elements as a single unit. The thought factor goes two ways from my standpoint, but its Bob's company, not mine. Bob has the perogitive to do whatever is best for his best business interest, as well he should have. Many good head hams were buying the elements and putting them into multiple configurations and have from what I read very happy. I am also confident that many hams without a lot of knowledge were buying the elements and doing off the wall home-brew stuff that did not work. Then they blamed Bob and wanted tech support and he got fed up with it. Hey I got this Heil cartridge I want to put in this 1973 epoxy laced mic from a Cobra CB unit that I got a flea market. Smells like it was in a fire but.....

2450. Re: 820s real power output

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-10-06 00:41:29 UTC
From: pchapman9202003
Topic: 2318 Message: 2450

I spoke too soon. Glad to hear that the elements are available again. Nevertheless, folks if you know what you are doing with them, rock and roll and go. If you do not, please use the support boards to get help. There is a lot of info out there to support experimentation with mic elements, in particular Heil, without putting stress on the manufacturer. Like bugging your final tube factory for an amp you haven't designed yet.

From: Eric Webner
Topic: 2429 Message: 2451

And we're worried about RFI from BPL!!!!!! (Broadband over Power Lines)

Yeah, OSB (Oriented Strand Board) is the chippy stuff. Better than the cheap black stuff that you can put your fist through, that they use to side some houses. But I digress. . . .

E

Bill K0ZL <coorsbill@...> wrote:
Don't know what OSB is, but if it's that chippy-lookin
stuff they make houses out of these days, that's it.

There are other RF heated products out there, but the
plywood presses are the most prevalent and most
powerful I think. 40-60kW...

From: KABOONA
Topic: 2318 Message: 2452

Wow, this topic (although a bit changed) is still alive!
Well, I found myself a MC-50 microphone to acompany my TS-820S for $45.00. So far based on the reports I am getting it was well worth it. It is in pristine condition. Now on to find the AT-200 tuner for the rig.

regards,
Jim

2453. TV-506 to TS-820 connections?

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-10-08 04:13:53 UTC
From: emporiaars
Topic: 2453 Message: 2453

Hello group, I recieved the Tv-506 6 meter transverter I purchesed, but I have no connecting cables. I could use some help on connecting it to my TS-820. The connectors are numbered 1-12 on each unit. Found the transverter schematic but not one for the 820. Lighting not to good, eyes aren't either, and the temper grows shorter by the day. I don't want to damage either unit and could use help from someone out there with the cable and an ohm meter, check transverter pin # to 820 pin #. Or any other help I can get. I'd like to get it up and runing without letting the smoke out of anything. Thanks in advance I hope. Mike

2454. RE: [TS-520_820_530_830] TV-506 to TS-820 connections?

If the 820 is the same as the 520 then it's a straight through connection, pin 1 to pin 1, etc. You'll notice from your schematic that all 12 lines are not used and that's where you have to be careful an not cross wires. By the way if you find a good source for the plugs and sockets please let me know. I also need to build a cable for connecting my 520SE to a TV-506. But that's a project which requires some slight modification to the 520SE.

Good luck, 73 de K7MEI, Brent

If you have to build male to female connectors, just remember that the pinouts may appear opposite on assembly so that they are correct when assembled. I.E. db9, db15, db 25 type stuff anyway. Not familiar with doing the transverter so your milage may vary. Just exersize caution.

2456. Finals toast?

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-10-08 17:37:40 UTC
From: Sean.....He's the cat that won't cop out
Topic: 2456 Message: 2456

I finally got my 520s on the air. Took a while but after 20 plus years and for the first time in my life, I put my own station on the air. The first time I was a ham I had my very own Elmer in my dad and always used his station, last going on the air when I was 16. I am now 37 and what an accomplishment it feels like to put my own signal on the air. Funny, I have a wife, two kids and a nice house but until I tuned up that 520 for the first time myself and made a QSO, I finally feel like a grown up. Do your own phsycological analysis.

I am on 40 meters CW in the evenings, mostly in the Novice section until my ear, hand, keyer coordination returns... Plus, I still haven't found a mic.

Questions/problems.

1. The rig seems to initially do a solid 110-ish watts forward but I have noticed that by the end of both contacts that I have made so far, it seems that the output drops to about 70 watts. I can dial up the carrier a little more to up the power but so far have not transmitted enough to see if the power stays up. Either way, I would think this should not be necessary. Are the finals on the way out???

2. The radio seems to have no life on 20 meters. Pretty much no meter deflection. The manual says the radio probably needs alignment? Seems easy enough. I have not opened the radio up yet to look...what kind of tool does this require? Any hints on getting this alignment right and not screwing up anything else in the process?

Thanks once again,

Sean WA2LKV

From: Brent Baum
Topic: 2453 Message: 2457

The connectors are the Hirose 1300 series (NTT), 12 pin, male, and the cable is a male-to-male mating to the female connectors on the radio and transverter. On the 520 series radios it's a straight through connection, pin 1 to pin 1, 2 to 2, etc. Kenwood actually uses only 9 or 10 of the pins, so caution here not to cross lines (like I did with my VFO connectors, really made the relays chatter for a moment). Also the Kenwood schematics look from inside the transverter or radio "outward" toward the cable, as if you were the electron looking for the correct pin to get out and race down the cable. So the physical arrangement of the connector may at first appear to be set up backwards to the schematic.

Hi Sean,

I'll take a stab at this. First of all, congratulations on getting your feet wet again. I am a little jealous because I am not quite yet able to transmit yet, after having moved from Ohio to North Carolina. Got the antenna, got the receiver, transmitter doesn't work, my TS-520 is too big for the small table we call a hamshack. . . .

But I digress.

Bill is certainly the expert on all this, but it does sound like the finals may be getting a bit "soft." Does your plate current Ip remain the same, or does it drop, also? Does it tune up well into your antenna?

Regarding twenty meters, I would ask if you are able to get any drive on that band (ALC) or just no plate current (Ip)? Does it receive on 20? I worked on a friend's radio where it didn't do anything on 80 and 15. Bill suggested that the oscillator crystals quit working, but to replace the oscillator transistor first to see if the circuit "wakes up." The transistor, of course, is a bit cheaper than a crystal.

Hope this helps you out. Good luck, and have fun!

73,

Eric KA8FAN

"Sean.....He's the cat that won't cop out even when there's danger all about....." <seanfried@...> wrote:

I finally got my 520s on the air. Took a while but after 20 plus years and for the first time in my life, I put my own station on the air. The first time I was a ham I had my very own Elmer in my dad and always used his station, last going on the air when I was 16. I am now 37 and what an accomplishment it feels like to put my own signal on the air. Funny, I have a wife, two kids and a nice house but until I tuned up that 520 for the first time myself and made a QSO, I finally feel like a grown up. Do your own phsycological analysis.

I am on 40 meters CW in the evenings, mostly in the Novice section until my ear, hand, keyer coordination returns... Plus, I still haven't found a mic.

Questions/problems.

1. The rig seems to initially do a solid 110-ish watts forward but I have noticed that by the end of both contacts that I have made so far, it seems that the output drops to about 70 watts. I can dial up the carrier a little more to up the power but so far have not transmitted enough to see if the power stays up. Either way, I would think this should not be necessary. Are the finals on the way out???

2. The radio seems to have no life on 20 meters. Pretty much no meter deflection. The manual says the radio probably needs alignment? Seems easy enough. I have not opened the radio up yet to look...what kind of tool does this require? Any hints on getting this alignment right and not screwing up anything else in the process?

Thanks once again,

Sean WA2LKV

If it helps here is the pin descriptions from my 820S Manual:

Pin Description
1 ALC
2 Occupied as Terminal
3 +210 VDC
4 No connection
5 -100 VDC
6 Transverter In
7 Transverter In
8 Normally closed relay contact
9 Ground
10 +210 VDC
11 No connection
12 Ground

Subject: RE: [TS-520_820_530_830] Re: TV-506 to TS-820 connections?

The connectors are the Hirose 1300 series (NTT), 12 pin, male, and the
cable is a male-to-male mating to the female connectors on the radio and
transverter. On the 520 series radios it's a straight through connection,
pin 1 to pin 1, 2 to 2, etc. Kenwood actually uses only 9 or 10 of the pins,
so caution here not to cross lines (like I did with my VFO connectors,
really made the relays chatter for a moment). Also the Kenwood schematics
look from inside the transverter or radio "outward" toward the cable, as if
you were the electron looking for the correct pin to get out and race down
the cable. So the physical arrangement of the connector may at first appear
to be set up backwards to the schematic.

Subject: [TS-520_820_530_830] Re: TV-506 to TS-820 connections?

If you have to build male to female connectors, just remember that
the pinouts may appear opposite on assembly so that they are correct
when assembled. I.E. db9, db15, db 25 type stuff anyway. Not
familiar with doing the transverter so your milage may vary. Just

exersize caution.

<brent.baum@s...> wrote:
> If the 820 is the same as the 520 then it's a straight through
connection, pin 1 to pin 1, etc. You'll notice from your schematic
that all 12 lines are not used and that's where you have to be
careful an not cross wires. By the way if you find a good source for
the plugs and sockets please let me know. I also need to build a
cable for connecting my 520SE to a TV-506. But that's a project
which requires some slight modification to the 520SE.

From: Sean.....He's the cat that won't cop out
Topic: 2456 Message: 2460

This will have to be continued...STUPID ME!!! I had the rig tuned on 40 and when I went to tune it on 20 I had the steps messed up. I had it in CW mode and not tune mode. Of course nothing at all was happening in CW mode because I didn't have the key down. DOH! So it appears to be actually working on 20. I just re-configured my antenna before dinner and a movie. I was hearing a lot more but didn't get to try tuning it up. I am on my way to the basement to try again. If there is anything left of 20 I will try. If not I will check the things you mention on 40.

Is there a danger to soft tubes? I can live for a while with less output for a while.

Thanks

Sean

Homer's infamous words. . . . DOH!

Good luck on it. Follow the steps carefully. While in TUN mode, get your drive and carrier (outer control) adjusted with meter in ALC mode, then adjust plate control with meter in Ip mode. Transmitting is controlled by the SEND switch. After you turn SEND back off, switch to CW mode, meter to RF mode, then flip SEND switch and while holding your key down, adjust PLATE and LOAD for max RF. Alternately tweak each of them. Switch meter back to Ip and adjust PLATE for about 220 mA (you might have to back off on LOAD a bit). Turn SEND back off, and you're ready to go.

Tuning up seems like a lot of work, but if you hook up to a dummy load, you can practice until you can do it in your sleep. Another thing to check before you get started is the bias current on the finals: while in USB or LSB mode, meter in plate (Ip) current, flip the SEND switch and make sure you get 60 mA. If not, the adjustment is on the left side of the 520. You will note that in CW mode, the idling current will go to about 70 mA.

Let us know if that makes a difference in the power output dropping problem, and note whether it happens on all bands. I don't believe that there is a danger if they are "soft."

73,

Eric KA8FAN

Do not forget that you can get falloff in your driver, that would embarras a good set of finals

. So do not jump of of the bridge, yet.

That is usually a chep quick fic. Might as well get them now, before they are more expenwive as colletions etc

2464. Re: [TS-520_820_530_830] Finals toast?

Yahoo group: TS-520_820_530_830 (2001 — 2004)

I agree on the transistor change first in any osc ckt
that doesn't work. Has worked in about 80 percent of
my "dead osc" issues. Another 10 percent were the
capacitors in the voltage divider at the base (grid)
of the oscillator device. The last 10 percent were bad
crystals.

2465. Re: [TS-520_820_530_830] Finals toast?

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-10-09 12:17:05 UTC
From: Bill K0ZL
Topic: 2456 Message: 2465

Soft finals can run for years with short tune-ups...
don't stay on them too long, dip quickly...

I had set of sweep tubes in my old FT-101 that would
drop from 290mA to 250mA in about 5 seconds... they
lasted that way for 5 years. On ssb peaks, it wasn't
even an issue and on CW I just cut power to about 75
watts.

Everyone has diff. opinion on what "real" ham radio is
all about.

1. Elmering a class of wannabes...

2. Waiting for the first snow to hang your antenna,
'cuz it works better if hung in bad wx

3. Gettin' yelled at for RFI on teen daughter's
fone...

4. Getting the "perfect shot" into the trees with your
bow and arrow for the dipole, only to watch the bit
end of the line arcing through the air and over that
limb, chasing the arrow!

5. Owning or operating, at least once, a ham station
without one single semiconductor in any of the gear
(all tube).

6. Arguing a guy down from $5.00 to $4.00 for a box of
junque at a hamfest.

7. Your bathroom has old issues of "73", Ham Radio or
QST in the mag rack.

8. Running 15 Yahoo ham groups, or more... hi

9. Having your trees trimmed, not for beauty but to
clear your wire antennas.

10. Neighbor mentions RFI on their fone/stereo/home
intercom; only upset because they can't hear BOTH
sides of the conversation! (bless 'em, get them a
receiver...)

Tube prices pretty steady lately.

Driver being weak is indicated by the ALC reading
dropping off.

Finals are checked by temporarily jacking the bias
current all the way up, then key rig, and watch the
meter... should come up to 180-220mA and stay there
for at least 3 seconds. If finals are bad, either it
won't come up that high or it will come up and then
drop quickly to lower level.

Be sure to check hi voltage too, one of the filter
caps being bad will drop plate V to about 430 volts
and thus plate I will be low.

Bill, you are right on the mark! I've been a ham for 46 years now (16 of those in your part of the planet) and I agree and identify with every point.

Have you sent these to QST?

2469. TS-830S Outputs

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-10-09 16:11:44 UTC
From: R Braddock
Topic: 2469 Message: 2469

After a long rest on my workbench, I decided to reapproach my old TS-830 output problem. After carefully checking everything I know to check and a fresh set of 6146s, I proceeded to bring her back to life. HV is 800+ and everything looks good. The receiver functions fine, but as soon as I flip the SG switch(not transmitting), the plates on the outputs start to glow. I know I asked these same questions months ago, but I am still stumped. It would be really helpful if I knew what the correct voltage ranges would be on test points of the PA board. I would really be proud to have my old 830 back in the shack!

Thanks in advance,

Richard AE4BP

Okay, where would I check this? What should it be and where does it come from?

Thanks,

Richard AE4BP

Nope, this "top ten" list is just for the 520etc group
members to enjoy! hi.

thanks

I left out the solder blob on the bare legs (never
solder in shorts), setting the ash tree limb on fire
with 1100 watts of RTTY on 40M, and settin' the dogs
to howling with BC heterodynes at full volumn out of
the NC-300... hehe

b

I hope you're not trying to trouble shoot this rig without at least a
schematic. There are voltages in this thing that can kill you or knock
you across the room.

Subject: [TS-520_820_530_830] TS-830S Outputs

After a long rest on my workbench, I decided to reapproach my old
TS-830
output problem. After carefully checking everything I know to check and
a fresh set of 6146s, I proceeded to bring her back to life. HV is 800+
and everything looks good. The receiver functions fine, but as soon as
I
flip the SG switch(not transmitting), the plates on the outputs start
to
glow. I know I asked these same questions months ago, but I am still
stumped. It would be really helpful if I knew what the correct voltage
ranges would be on test points of the PA board. I would really be proud
to have my old 830 back in the shack!

Thanks in advance,

Richard AE4BP

Good comment, Bill. If it's not broke enough, don't fix it!

I love may Marksman model 3061 slingshot and Zebco 202 combo. The only problem is that if one is looking for the manly way to get it done by staying out there all day with a fishing rod, or throwing rocks and strings, it's a bummer cuz I get it done on the second or third shot every time. Fifty feet up, no problem. I'm pulling rope within 15 minutes. What a girly-man kind of let-down!!! Even worse, it cost less than 15 bucks to build it. Such depression as a result, HI!!!!!!

I am pretty familiar with tube gear(I restore vintage audio stuff) and I can follow the schematic. I am really not familiar with the history of this one, though, since I bought it on Ebay a few years ago(it never did transmit). After extensively going through the PA, it looked like it had been hacked up good(CBer?). All of the resistors were burnt to a crisp, etc. And, I completely replaced the power supply board. So, I tried to put everything back into order based on the schematic. Maybe I missed something. It would really be helpful if I could find some hi-res photos of the PA area showing clearly what connects to what. Actually, a working unit to compare to would be great. I might check around locally. I just don't know what the proper voltages should be at which point(ie. Photofact).

I hope you're not trying to trouble shoot this rig without at least a
schematic. There are voltages in this thing that can kill you or knock
you across the room.

Sounds like you have either no grid bias or too little. Check the grid
voltage.

Subject: [TS-520_820_530_830] TS-830S Outputs

After a long rest on my workbench, I decided to reapproach my old
TS-830
output problem. After carefully checking everything I know to check and
a fresh set of 6146s, I proceeded to bring her back to life. HV is 800+
and everything looks good. The receiver functions fine, but as soon as
I
flip the SG switch(not transmitting), the plates on the outputs start
to
glow. I know I asked these same questions months ago, but I am still
stumped. It would be really helpful if I knew what the correct voltage
ranges would be on test points of the PA board. I would really be proud
to have my old 830 back in the shack!

Thanks in advance,

Richard AE4BP

Darn, that leaves me enough time and money for an 807
or two... can't have that.

Ok richard. Drop the cover off the bottom of the rig
and look for the grid pin on the tube sockets... then
measure it in TX mode and tell us what you see there.

All true, let me add moving a tr4c with the cover off and powered up.
SHOCK, drop, U.P.S. back to Drake for new pto!

Bill K0ZL <coorsbill@...> wrote:

Everyone has diff. opinion on what "real" ham radio is
all about.

1. Elmering a class of wannabes...

2. Waiting for the first snow to hang your antenna,
'cuz it works better if hung in bad wx

3. Gettin' yelled at for RFI on teen daughter's
fone...

4. Getting the "perfect shot" into the trees with your
bow and arrow for the dipole, only to watch the bit
end of the line arcing through the air and over that
limb, chasing the arrow!

5. Owning or operating, at least once, a ham station
without one single semiconductor in any of the gear
(all tube).

6. Arguing a guy down from $5.00 to $4.00 for a box of
junque at a hamfest.

7. Your bathroom has old issues of "73", Ham Radio or
QST in the mag rack.

8. Running 15 Yahoo ham groups, or more... hi

9. Having your trees trimmed, not for beauty but to
clear your wire antennas.

10. Neighbor mentions RFI on their fone/stereo/home
intercom; only upset because they can't hear BOTH
sides of the conversation! (bless 'em, get them a
receiver...)

OWWWWW

bit by yer own Drake.

Dragged my forearm across the tube anode connectors in
powered up 830 once. Also was transmitting about 30
watts. Neutralizing with cage off (DUMB).

Next thing I know I was sittin on the floor. Bonnie
(YF) comes running downstairs asking me what I
hollered for. I didn't holler, I told her. Yes you
did, she said, I heard you yell. Wow. Looked up, rig
still in TX mode, 30 watts.

I sat there looking at the flesh on my arm crawling
like a something that was just hit by a car and was in
the process of meeting it's maker. Thought, gee whiz,
sure glad that didn't go through my heart. Then
something drew my attention to my other hand. There on
my thumb and index finger were two small white burn
marks. It HAD gone through my heart.

Spent rest of day wondering what God had spared me
for... Figure if it had happened ten years later,
someone else would be running this group right now.

Be careful out there.

I was troubleshooting an old rig to which I had no service manual and wondered if the votages were correct to the final tubes. I found a diagram of the tube pinouts on the Web which showed the range of voltage that could be expected for each pin and used that to check. It showed me that the finals were indeed shot, since the voltages were in the ballpark and I had drive to the final.

I just picked up the Marksman 3060. I plan on also picking up either the Zebco 202 or 404. My question is how / where did you attach the reel to the slingshot?

I did that once, too, many years ago, with a Johnson Viking Ranger that was on the metal workbench, running 750 volts and full RF power. Through my right arm outward and left some nice RF burns. One hand in the pocket. . . .

Bill K0ZL <coorsbill@...> wrote:
OWWWWW

bit by yer own Drake.

Dragged my forearm across the tube anode connectors in powered up 830 once. Also was transmitting about 30 watts. Neutralizing with cage off (DUMB).

Next thing I know I was sittin on the floor. Bonnie (YF) comes running downstairs asking me what I hollered for. I didn't holler, I told her. Yes you did, she said, I heard you yell. Wow. Looked up, rig still in TX mode, 30 watts.

I sat there looking at the flesh on my arm crawling like a something that was just hit by a car and was in the process of meeting it's maker. Thought, gee whiz, sure glad that didn't go through my heart. Then something drew my attention to my other hand. There on my thumb and index finger were two small white burn marks. It HAD gone through my heart.

Spent rest of day wondering what God had spared me for... Figure if it had happened ten years later, someone else would be running this group right now.

Be careful out there.

SG voltage in TX is 192.1VDC.

Richard

Ok richard. Drop the cover off the bottom of the rig
and look for the grid pin on the tube sockets... then
measure it in TX mode and tell us what you see there.

Hi to all in the group.
This is Dave in France.Thanks for approving my application to join.
I've been a SWL for 50 years and I'm at last taking my novice licence.
My TS820s should arrive before Xmas and I'll be fitting the QRP mod
and learning to 'drive' it properly.
I was born in UK, lived in South Africa and now retired amongst the
vines. No local QRM but in the bottom of a small valley so not the
best QTH for radio.
73s
Dave

Yeah, but the sun and the grapes ought to make up for being in a radio "hole." Glad to have you aboard and good luck in your endeavours. This is definitely the group to call on if you need any help, TS-820S or otherwise!

Bonjour Dave
Welcome to the group. I also live in a French speaking environment. Glad you have finally become a ham!!
Personally I would prefer to live where you are with no QRM and trade it off for being in a valley. I think that you can beat the 'bottom of valley' problem in part with antennas that have specific radiating patterns. If you can get your hands on a ARRL Antenna book it has quite a bit on radiating patterns.
At least you probably will not have BPL which is having everyone in North America scared. It seems that last week the FCC has changed its rfi requirements to suit BPL.
BPL= Internet access over powerlines using H.F. frequencies.

Hi Dave, welcome to the group.

You should do fine on the lower HF bands, with a full
size wire antenna, less than 1/4 wavelength high.

Bottom land is best for 160, 80 and 40 metres!

Vy 73,

Bill

I was troubleshooting an old rig to which I had no service manual and wondered if the votages were correct to the final tubes. I found a diagram of the tube pinouts on the Web which showed the range of voltage that could be expected for each pin and used that to check. It showed me that the finals were indeed shot, since the voltages were in the ballpark and I had drive to the final.

Hello all. I have a TS820s with which I am having a blast besides a little rectification from my home stereo system. My question is the following. I have a 20m dipole that I cut myself and was using that nicely with the rig until I got a hold of an antenna tuner. I connected the tuner and decided to explore lower frequencies. I am able to lower the SWR with the tuner and the dipole to about 1.5 on 40 and 75m. I am using the tuner and a separate SWR meter. I have not transmitted this way other than what is required to tune the radio. Is this OK to use this way? Will I damage anything? Is there much being radiated?
Thanks in advance for any help.

regards
Jim

Topic: 2493 Message: 2494

No problem. The you should be able to run the rig fairly even at 2 and some people say 3. 1.5 is completely, totally fine. I am running a 20 meter 1/4 wave vert. It tunes to about 1.5 on 40 with a tuner. I have worked DX on 40 no sweat. As far as 75-160, if the tuner will match the antenna to the rig, no problem. The rig only knows that it is seeing 1.5. With regards to is much being radiated. If someone answers you, than enough is being radiated. Make sure to pay attention, I can't use an antenna tuner to tune my 20 meter antenna lower than 40. It starts arcing and that point, obviously, all bets are off.

Jim,
I don't recomment using short antennas with ANY tuner.

There are such high circulating currents in most tuners used today when the antenna is shorter than desired, that while damage may not be apparent right away, sooner or later you will do it parts of the tuner unless it's a very large, expensive KW rated job. Even in those cases, I have seen severe and even irreparable damage done to the major structural components of the inductor, connectors, etc., that I was convinced that this was not the way to go.

There are many good "shortenend" antenna designs that will work safely with your tuner. I encourage you to look at the ARRL Antenna Handbook first; then other wire antenna books, to see if you can find an antenna design that will work for you.

73,

Bill is right. In addition, your antenna will be very inefficient--can't put a number on it, but the shorter it is in relation to wavelength, the less efficient it will be.

In addition, you will be heating your coax and perhaps damaging it if the mismatch is high enough, and drastically increasing your RF in the shack.

Hi All,
I worked RTTY on my kenwood ts 830s full blast on RTTY and must have blown out something in the microphone and or final unit because I only get about 7 watts output on LSB?USB with the mic gain control on maximum. Anyone have any ideas about happened? However, I still get about 100 watts output on CW. Does it pay to get fixed or should I just use the rig for CW and buy another rig for sideband/rtty??

Thanks for your responses.
Aaron

What do you get on voice, whistle up, into dummy load?

Check continuity of the ground pin on the rig's mic
connector, to rig ground. Forget which one that is;
it's in your owner's manual under mic wiring. Perhaps
you lost the ground return for the audio.

I also suggest no more than about 25-30 watts on RTTY
or PSK31, so as not to exceed the 6146B plate
dissipation ratings.

Bill there is a trimmer cap in the VFO under the
silver foil that you can access to bring the dial back
in. Calibrate your counter against WWV or another
standard first.

Re-cover the hole with Scotch (tm)_ brand tape after
adjustment; this will reduce temp drift from air
currents.

2508. Re: [TS-520_820_530_830] SSB virgin

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-10-18 17:08:43 UTC
From: Sean.....He's the cat that won't cop out
Topic: 2499 Message: 2508

I am but a General...though my Extra book is on the way. 20 is good with me. Would you consider 14.250 or as close as qrm will allow at about 8:30 CST? The mic has not shown up yet but I will email you as well as the list when and if it shows up today. If you don't hear from me, please go about your business.

Thanks,

Sean - WA2LKV

From: Sean.....He's the cat that won't cop out
Topic: 2499 Message: 2509

Hi Bill...and anyone else interested,

My wife called and said the mic arrived at my house. So...I will be trying
to conjour a nice signal on 14.250 at 8:30ish Chicago time. If the frequency
is occupied I will be near by.

Thanks,

Sean - WA2LKV

Clean the T/R relay first.

Use Cailube MCL or DeOxIt, apply sparingly to the
contacts, then draw a sliver of bond paper (dollar
bill works well, about 3/4" long by 1/8" sliver in a
pair of hemostats... for 1.00 you get about 100
strips! hi)

2512. SSB virgin - 20 DEAD?

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-10-19 01:53:54 UTC
From: Sean.....He's the cat that won't cop out
Topic: 2512 Message: 2512

Hi guys,

It is now 8:52. It took me a little while to get going. In my excitement I tuned the radio on 15 instead of 20. Anyway I was on 14.250 by 8:40. I didn't hear y'all but I didn't hear anyone else either. I am very, very sorry if you showed up and I missed you. I am going to go back down and listen for a bit longer and then try 40 (just listen for the guy with his vox delay all goofy).

Thanks and all apologies if I showed up too late.

Sean - WA2LKV

Right you are. I am going to try 40 this evening (10/19). I will be in the General portion. I can't say where exactly...probably up toward 7.300 as that seems to be the area with the most space free of foreign broadcast. 8:30ish central time again.

A pretty long shot, but it neevr hurts to try!

Anyone parting out or having an IF board for the
TS830S? I am desparately in need of one of these. What
happened to mine is a long story!

Will pay top$ and provide a US Shipping address and
payment by family in Boston.

Indeed.

As in the case of someone a short time ago, claiming they REFUSE to use ebay "for personal reasons" and wished to obtain an "affordable" (on fixed income) replacement for their "beloved TS-520" that was destroyed in a "weather related" catastrophe.

In actuality, that person has a very active account on ebay, where he has been buying and selling lots of ham radio gear, and (at that time) currently had up for auction the very same "beloved TS-520" he was claiming on this list had been destroyed -- and, even using the same picture in his ebay listings that was posted on his QRZ lookup page!

In reality, I suspect he was trying to play on our emotions so that one of us would sell him a radio at a 'bargain price', so that he could turn around and sell it for profit on ebay.

So, yes... please, if you might, and if you have the time... do give us the details on your long story... ;)

73 de AI4AI,
- Brian

OK, then I will start on 20. Better for me, that is what my antenna is designed for. I will try 14.250 first. Very often by the time I get home, yell at the wife, put the kids to bed and such 20 is dead. I only get to work 20 on the weekends. I will try 20 and if that is not hoppin' I will move to 40.

2528. RE: [TS-520_820_530_830] WTB TS830S IF Board

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-10-20 05:55:23 UTC
From: akshay daniel
Topic: 2517 Message: 2528

Hello Brian & others interested....

I had a problem with one of the Molex connectors (I think its no.14 on the IF board) that carries 300V on one pin and the AGC on the other. I made a stupid mistake by adapting another kind of connector. It was ok as long as I used the rig, but a mishap by a gentlemen I loaned the rig to, resulted in 300V on the AGC line. The TX works fine, but the RX is dead and the s meter is end pegged. I suspect it killed all the FETs in the IF chain.

I replaced the AGC transistor, the meter drivers and a few more FETs and TRs, but it (RX) was still dead. I spent days over this and finally decided that it would be easier for me to replace the board. As I mentioned to Bill (K0ZL) even before you made your posting suspicious of my intentions, this board already had been messed up by the previous owner and the PCB track did never looked very pretty!

As the rig is pretty good except for the IF board, I would like to see if I can find a replacement.

Again, sorry for the bandwidth, but I guess I had to explain what happened to my "beloved" 830!

It is always easy to explain when it is the truth. I am human and I react, but ideally, I should not be bothered by what anyone says, as long as I am honest in the eyes of God. I can only rest assured that the others on this reflector will understand my intentions better than you have.

73,
Ron, 4S7RO

2534. Update on TS-520 with TX problem - Microphone recommendation?

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-10-22 00:18:44 UTC
From: Charles Kaross
Topic: 2534 Message: 2534

I bought a dummy load and borrowed a scope from a friend. Spent a Saturday a couple of weeks back going over this rig.
Seems that an intermittent mode switch was the main problem.
Cleaned all switches and controls and was able to go through the tune up procedure and get the expected results.
Also peaked the coils underneath following the alignment procedure in the manual which seems to have brought up the receive, especially on 15m. Also, DRIVE control needs less adjustment for max. RX sensitivity on all bands.
Looks like it is transmitting, although I don't have a wattmeter to measure the output power
Didn't have a chance to put it on the air yet, but plan to do that using my neighbor's beam.

The mic that was provided with the rig looks like it came from an old Pace CB set and although it works, I'm looking to get something better.
I am leaning to the standard MC-50 and have found a few available on eBay that I am watching.

I was wondering if anyone had any recommendations other than the MC-50, or am I better off sticking with it? Understand this rig needs a high Z mic, and am interested in what the group has to say.

Hi all,
Another one for Bill.
This dummy is looking at dummy loads but the connectors have me
confused.
The Kenwood has an SO239 socket which requires a PL259 plug(I think?).
Some dummy loads have an "N" connector.
The What is an "N" connector??
Cheers
Dave

> The What is an "N" connector??

I'm not Bill, but I'll answer.
An "N" connector is a different type of coaxial connector, most commonly seen in commercial VHF and UHF equipment, but sometimes used on high-end amateur equipment at VHF and UHF. It has much lower loss than the SO239-PL259 type, but is overkill at HF.
You would need an adapter to use it with a PL259, so you probably don't want that, although you could make or buy a cable with a PL259 on one end and an "N" on the other.

2539. RE: [TS-520_820_530_830] SO239 connector.

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-10-24 03:27:07 UTC
From: Bill Gerhold
Topic: 2537 Message: 2539

The □N□ connector is simply another coax connector. The difference is not only

mechanical but also in the way it is seen by RF energy. The PL-259 is known

as a non-constant impedance connector whereas the □N□ connector is

known as a constant impedance connector.

This terminology is based upon the frequency of use with each connector. The

PL-259 starts to lose its usefulness around 300mhz. The □N□ connector is good

up through 900mhz. At HF frequencies, either connector is ok to use.

For the 520/820 series of radios, it makes no difference which connector you use

just as long as they are able to mate together.

DAVE
THE N connector is another type than pl259 or so238 they have less loss and better for higher frequency operations

if you get a dummy load with N connectors on it they make an adapter so you can put your pl 259 on or if you go uhf you can use N type

If you run across a surplus dummy load or comerical one that has a N connector on it for a good price Grab it you can get an adapter at Radio Shack

Hi, names Mack, but since buddies at work have dubbed me with Mack "Attack" that is what I go by.
I am 50 years young and just recently received my general class ticket. Some might refer to me as a newbie
and would be more or less correct as far as being a licensed ham. I spent four years in the Navy as a Radioman, 1972-1976. In 1978 or there abouts I met someone who got me interested in amatuer radio. I bought a Kenwood 520 from him, that had been modified for 11 meter. The plan was to get my amatuer license, but in the mean time I could operate SSB on CB bands. Well I took a course from Heathkit for novice and tech and got my code up to about 13 wpm. But things happen, ie. daughter was born, we needed more room, bought another fixer upper, changed jobs several times and etc. etc. Long story short never got my license untill things settled down some. That was 25 year later! Some guys I work with got their licenses and listening to them rekindled my interest. I look forward to exploring the many new aspects of this hobby and being part of amateur radio and this group.
To get me started I have bought another Kenwood, a 530 this time and find it comfortably familar in appearance and operation to the 520, only with a few more bells and whistles. It worked fine when I bought it but since has devolped a problem. A brief description of problem: I hear no stations on any of the bands. The S meter shows a 9 DB signal and does not vary much when I turn RF gain up or down. I have noticed what looks like some signal activity that will show up as fluctuation between 9 and 15 on s meter, but still no audio. These problems developed after I took IF out to fix a loose connection that was affecting the RIT. I have ordered service manual from manuaman.com. If anyone has had similar experience or have some tips or advice please let me know. TIA and 73s.

2544. Re: [TS-520_820_530_830] SO239 connector.

N connectors are best for UHF and above. They are
expensive and harder to install (for me) than
PL-259/SO-239.

Ham "standard" for HF up through 2M and most 450 apps
is the PL-259 plug mating to the SO-239 socket.

PL-259 is about 1.50 each; N connectors run 5-10 bucks
at hamfests, maybe less for older ones.

Hi Charles,

The MC-50 seems to be a good mike. I, however, have used for many years an Astatic D-104 microphone (the "lollipop" mike). It has worked very well for many years and generates good audio reports with my TS-520. I have seen many of these same mikes used with CBs and other radios. If you are interested in one, stay away from one of the amplified models -- you don't need or want the pre-amp.

Charles Kaross <ckaross@...> wrote:

I bought a dummy load and borrowed a scope from a friend. Spent a
Saturday a couple of weeks back going over this rig.
Seems that an intermittent mode switch was the main problem.
Cleaned all switches and controls and was able to go through the tune
up procedure and get the expected results.
Also peaked the coils underneath following the alignment procedure in
the manual which seems to have brought up the receive, especially on
15m. Also, DRIVE control needs less adjustment for max. RX
sensitivity on all bands.
Looks like it is transmitting, although I don't have a wattmeter to
measure the output power
Didn't have a chance to put it on the air yet, but plan to do that
using my neighbor's beam.

The mic that was provided with the rig looks like it came from an old
Pace CB set and although it works, I'm looking to get something
better.
I am leaning to the standard MC-50 and have found a few available on
eBay that I am watching.

I was wondering if anyone had any recommendations other than the MC-
50, or am I better off sticking with it? Understand this rig needs a
high Z mic, and am interested in what the group has to say.

Hello to all on the group. Thank you Bill for letting me into this esteemed gathering of individuals who obviously have great taste(ha).

I live in southern Oregon and have been into various things having to do with radio since I was BCB dxing starting around 10 years old. I'm also a musician and record my own music.

I am "almost" a Kenwood owner. I just purchased a 530SP/D...It should be in my mits by early next week!
Also I will be a General upon passing my code test next month. VERY much looking forward to getting on HF!!!

One thing I'm wondering is what does the "D" stand for in TS 530SP/D?

Robert

Hello everyone, this is my first posting but I always read the postings. I have to post some info here that will make everyone smile as much as I do.
I have a ts830s that has a billion trillion of hours on it....really. I never turn it off , it's on 24 hrs a day , 7 days a week and it is used daily to run a net that I am sometimes net controller of. It has the original finals in it and has all the original dail lights !!! Been running it like this for ten years plus. Every 6 mos or so I pop the cover and spray the fan with DEOXIT and also the band switch, thats been the only maint ever done.
The ts 830s and other older TS series radio's are the work horses of ham radio. I have had Collins (just sold over $6,000 Collins gear) also have Drakes , Icom's ,Yaesu etc , but the ts830 runs proud as hell against all of them. Infact , my XYL Mary N3YL prefer's the ts830 over every radio we have....first choice. We also have one 830 stored in it's original box , just incase this one would ever fail.
Just thought I'd share this info....my 2 cents.

Hi Robert,

Welcome to our highly es-steamed group! hi hi...

Slide guitarists sure are an odd lot...

Congrats on the General and the new rig.

The "D" stands for dillybopper, which the 530 did not
come with when stock.

Bob that is great! Keep 'er hummin.

might want to blow compressed air in the PA cage now
and then to get all the cooties out.

Also put one drop of good old 10W-30 on the VFO shaft
once a year.

Bill,

I'm still wondering why the manual has a "D" at the end of the rig number(ha)..... I had one gent tell me it meant the rig has 6 meters (must be whacked) and another said it means "digital" display (which seems reasonable).
Your dillybopper idea has it's merit's, all the "newer" rigs have lot's of dillybopper's on them. As a matter of fact they seem to be mostly dillybopper.
OK I'll shut up.

Robert

Does anyone know what years the 530SP(/D) were manufactured?

Topic: 2558 Message: 2558

I also like the mc-50 and the D-104 w/o amplifier.

The chrome 104 is nice to look at too !

Plus, you can use the back of the mic as a
mirror to see what you've got plugged into the
back of your ts-520.

Another source of no cost manuals is

http://www.mods.dk

sometimes it is a little slow to d/l so

http://www.manualman.com for printed manuals at fair price !

Robert,

According to information buried in the TS530SP/D operating and service manuals, the /D version uses just one S2001A (Japanese 6146B) in the PA. It is rated at 160W PEP and 130W CW input (as against 220W PEP and 180W CW for /SP). I recall that somewhere in one or the other of the manuals there is mention that the /D version was produced for the Korean market. The AC line voltage setting is slightly different between the /D and /SP.

The difference between the /S and the /SP is that the /SP has an audio notch in the place occupied by the AF gain control and the AF gain control is concentric with the RF gain.

The TS530 was made in early '80s - I don't have a range of dates but I have a copy of the review of the TS830 dated July 1982 that appear in "Radio Communication" (RSGB) in the UK - the '530 was a lower spec version of the '830 although some of the PCBs are common to both.

It's an semi-imaginery bell and/or whistle used to
justify slightly higher suggested retail price.

Shopped for cars, computers or PDAs lately? Everyone
is doing it, hi!

The 850 has 73 dillyboppers, and that is just on the
front panel! har...

This group is a rip. Never fail to laff my guts out
(ouch-just had surg...)

2567. TS-820S Meter Lamp

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-10-27 18:37:44 UTC
From: va3spx@rac.ca
Topic: 2567 Message: 2567

Hi Folks,

I am a new TS-820S owner.

The meter is not illuminated so I assume I must replace one or more bulbs.

Are these commonly available?

Thanks,
Steve Phillips

Thanks.

I guess I will oper it up and check it out.

Can I acces it from the top or do I need to take off the front panel?

Thanks,
Steve

There is not really a problem with calibration. The rig is spot on
with respect to the digital display. It's the analogue dial that is
out; its seem that one needs to rotate the analogue dial whilst not
moving the shaft to bring the digital and analogue dials into sync
with one another.

See what you can see with RF probe on DVM... I will
have some time to chase schematics now that I am off
work for a bit.

2573. Re: Korean Version

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-10-28 04:26:59 UTC
From: Robert
Topic: 133 Message: 2573

Richard,

Thanks very much for the info. I've put in many, many hours of
internet research on this. Finally, an answer!

I'm not sure what to think now however. I purchased the rig via the
internet(qrz.com) and the gent(original owner) said it put out 100
watts on all bands. That would be rather difficult with only one
tube!!
Maybe there's a miscommunication somewhere. The radio should arrive
early next week. We'll see when I open the box.

If it is a Korean version I wonder if a 6146B would fit into the same
slot as an S2001A?? Or are S2001A's $350.00 a piece(hi)!

Robert

Just a thought about the "D". Maybe it stands for "different". Hi Hi.

Yes, I'm going. I just couldn't resist doing that. Kerrod. VK4TKA.

2575. TS530/D

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-10-28 07:34:22 UTC
From: Richard Harris
Topic: 2575 Message: 2575

Robert,

Do you actually have a /D version? If so, it may be wise to check the AC line settings because the /D is 110/220v rather than 120/240V.

I agree about the rating of the single tube version (the figures from the manual are input not output), but 130W input on CW for a S2001A/6146B seems a bit severe to me. I suppose that would give about 85W output. A quick tune-up would seem to be in order!

S2001As are difficult, maybe impossible, to get hold of but I believe that 6146Bs are OK. I have a TS510 with one of each fitted.

I bought my TS530SP on UK Ebay recently and am delighted with it. I've since fitted a CW filter. Only problem with it now is intermittent band-change switch, but I hope to get some switch cleaner on it this weekend. So nice to operate a piece of equipment where each function has its own control on the front panel.

If you don't have an Operator's Manual go to www.mods.dk, or www.kb2ljj.com. I haven't found a (free) Service Manual on the net but maybe another Member can give you a URL.

I will be looking for US stations this weekend in CQWW on 20m.....

Richard,

Thanks very much for the info. I've put in many, many hours of internet research on this. Finally, an answer!

I'm not sure what to think now however. I purchased the rig via the internet(qrz.com) and the gent(original owner) said it put out 100 watts on all bands. That would be rather difficult with only one tube!!
Maybe there's a miscommunication somewhere. The radio should arrive early next week. We'll see when I open the box.

If it is a Korean version I wonder if a 6146B would fit into the same slot as an S2001A?? Or are S2001A's $350.00 a piece(hi)!

Get the 12v grain-o-wheat bulb from RatShack, if you
can find it. the number is 272-1092C

From the top; just pull the little black rubber
grommet out of it's hole in back of the meter.

Rig off... cut the red wires close to the lamp,
lap-solder and heat-shrink new lamp leads to old ones,
and you may have to modify the grommet to fit the new
lamp. I just cut the back of the grommet with wire
cutters until there is a large enough hole to shove
the new lamp in.

Thanks!

I opened it up and had a look last night.

At least one has been replaced before.

There are two screws which hold the meter assembly. I unscrewed those and I could easily access the rubber grommets, etc.

Should be a breeze.

I checked stock at the closest shack online and they have 3 packs. I think I will buy them all! ;-)

S2001A's are identical to 6146B's. The 530D schematic seems to imply that the second socket for the other S2001A (530S & SP) is there and wired up. Looks like they made some "minor" changes (capacitors) to the tank circuit to accommodate just the one tube. Didn't look close to the driver circuitry. Probably could be converted over to a 530SP.

Richard,

I don't have the rig yet. It should be here via UPS on tuesday. The internet pic I saw of it had a manual with the /D at the end. It may not be a D. The previous owner may have just acquired that type manual. I'll check it all out next week.
I agree with you that these are quality radio's. Knobs, case...sturdy and "manly"(hi)! Does your SP put out full power or has there been some degradation?

Robert

Pete,

Thanks much for the info! Sounds like if it is a "D" I could probably switch it back without too much problem. Hmm?
I'll have to wait and see. I'll get it tuesday via UPS.

Thanks, Robert

My TS-820S meter is once again illumined.

Thanks for the help!

Steve

The operating manual for the 530SP and the 530D, as indicated in his picture, is the same manual. Unless he bought the rig in Korea, the odds are that it's an SP. The "D's" were never sold in the U. S. The title of his post says 530SP. The latest service manual for the 530S says 530S/SP/D.
Pete, wa2cwa

On Thu, 28 Oct 2004 19:16:16 -0000 "Robert" <kd7aub@...> writes:

Richard,

I don't have the rig yet. It should be here via UPS on tuesday. The internet pic I saw of it had a manual with the /D at the end. It may not be a D. The previous owner may have just acquired that type manual. I'll check it all out next week.
I agree with you that these are quality radio's. Knobs, case...sturdy and "manly"(hi)! Does your SP put out full power or has there been some degradation?

Robert

2587. 520s tuning wierdness

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-10-29 14:16:01 UTC
From: Sean.....He's the cat that won't cop out
Topic: 2587 Message: 2587

So I have had my eBay purchased TS-520s on the air for 3 weeks now and things seem to be going well BUT....When I tune up the rig, on any band it seems, peaking the load is fine, dipping the plate is fine but then when I start to "walk the RF" up with the plate and load knobs, when I get to almost where everything is perfect, when adjusting the load control, just at the point where you would get maximum meter deflection, the meter drops and the output goes to zero! If I move the load control ever so slightly off that sweet spot everything comes back and is fine. This is everytime I tune up. This seems really, really odd but I AM getting out OK and getting 110 out more or less across the bands. So strange that at the point where the radio would be most accurately tuned up, it craps out (shorts out?). This only happens when I am doing the very, very final adjustment of the load control. Any thoughts? I looked briefly in the radio and could see or smell nothing cooked but I have to admit to not being terribly thourough. When this occurs the meter in the rig AND the meter in my transmatch both go to zero so I know it is not just a meter issue. Has any experieced similar happenings?

TNX,

Sean - WA2LKV

I don't have a schematic of the 830 with me here, but
could it be back-back diodes or a static discharge
tube at the input to the RX? I have had this problem
with other rigs (older Yeasu) and it has often been
the above protection diodes/buld that was kaput!

Tried cleaning the variable caps? Could be arching
across the plates due to dust or even a small insect
lodged between them?

You mean it receives STRONG sigs only?

Chances are one or both of the 160m coils is burned in
the RF section.

I don't think these have a receive ant fuse like the
Yaesus...

Sorry for bad news.

Give me call at home if you need help.

Unplug, open the PA enclosure, short the plate caps to
ground, then check the spacing on the loading cap.

The plates will close up with wear on the back
bearing. It is adjustable. You will need a bright
light to check as the gap is only about 0.008" or less

You know I have only had this radio a few days but I really like it.

There's something special about these old rigs.

It's like they have a certain character that the new stuff doesn't have.

Don't get me wrong, I appreciate all the amazing things they have added to modern rigs. I just like to be in touch with some of the roots so to speak.

Can you tell I'm a new ham? ha ha

I have been around radio since I was 12 and I hit 40 this year. But I just got my ham license in April. So it's an new from a personal experience perspective. And I am enjoying it very much.

Now when is that G5RV arriving?..... ;-)

2599. TS-530 Paint

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-10-29 23:36:04 UTC
From: ke4iza001
Topic: 2599 Message: 2599

I was lucky enough to purchase a TS-530S from the original non-smoking owner with new finals. Controls and face are as perfect. The case is another story although no real bad. No rust or dents. Simply wear marks where the paint has been rubbed off. I also have the matching speaker with the case in the same condition. I want to remove the upper and lower radio case and the speaker case and paint them. Maybe even bake them in the over afterwards. Has anyone ever painted their cases? It is not alot of trouble but I do not want the results looking like a monkey with a spray can went wild.

Thanks and 73

Jim - ke4iza

2600. Re: TS-530 Paint

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-10-30 01:52:36 UTC
From: n9wb
Topic: 2599 Message: 2600

Jim:

The trick will to be to find a colour that matches the original paint. Many paint stores that supply paint to auto dealers can mix any colour with a computer and put it into a spray can.

Remove any rubber, plastic, leather, or anything that will melt. Remove the speaker. Sand the case smooth and remove any rust. Deep gouges can be filled with glazing putty and sanded. Spray with primer. Bake. Spray with an even coat. Any runs should be dried and then sanded and repainted. Touch up (like corners and edges) can be done with a bit of paint sprayed on the end of a stick or piece of broom straw with a blunt end. I have found that Q-tips leave cotton fuzz although the stick with the cotton removed works well.

Baking: Place in oven (your wife will love this) and set to 175 F. Bake for 3 to 4 hours. Be sure that it is not hot enough to scorch the paint. You can also air dry it but it must be in a warm dry place with no dust in the air. Air-drying takes a couple of days per coat.

If you live in a warm climate or if it is summertime, you can let the paint air-dry partially then set it in the sun for several hours. This usually works best if temperature is 80d F or higher. Once I used an old car with the windows up.

Be careful about dust particles. If this does happen, sand smooth and repaint.

If you want a really shiny finish, you can rub with a wet rag with automobile polishing compound and water. Be sure the paint is fully dry. The original Kenwood cover is not shiny so you can skip this step.

BTW, Be sure to have object at room temperature when applying paint. If object is hot, you will have problems.

Grounding: Where the screws hold the case on, there needs to be electrical contact to the chassis. The underneath side should have bare metal in this area. If you paint the underneath, put masking tape over these spots so there will still be conductivity with the chassis underneath.

John,

Before you fart around with getting a transformer, try the microphone out as is. While I realize that Kenwood calls for a 50k mic, I spent a lot of time trying to match a D-104 to my TS-520 before I tried plugging it in directly. It worked great! The transformers simply resulted in poor audio and distortion.

Let us know what works for you.

73,

Eric

My first rig was a Johnson Viking Ranger. . . and so was my second. I've had my TS-520 since 1980 and am now working on repairing a Drake C-line. Must be the love of cold beer and warm tubes!

And for you newbies, both of those can be refered to as an "807!"

Wonder if the power supply is the same for both models?

peter A markavage <pmarkavage@...> wrote:
S2001A's are identical to 6146B's. The 530D schematic seems to imply that the second socket for the other S2001A (530S & SP) is there and wired up. Looks like they made some "minor" changes (capacitors) to the tank circuit to accommodate just the one tube. Didn't look close to the driver circuitry. Probably could be converted over to a 530SP.

On Thu, 28 Oct 2004 04:26:59 -0000 "Robert" <kd7aub@...> writes:

Richard,

Thanks very much for the info. I've put in many, many hours of internet research on this. Finally, an answer!

I'm not sure what to think now however. I purchased the rig via the internet(qrz.com) and the gent(original owner) said it put out 100 watts on all bands. That would be rather difficult with only one tube!!
Maybe there's a miscommunication somewhere. The radio should arrive early next week. We'll see when I open the box.

If it is a Korean version I wonder if a 6146B would fit into the same slot as an S2001A?? Or are S2001A's $350.00 a piece(hi)!

Robert

Some call them 813s (I guess the more potent ones!).
We still refer to them as 807s when calling someone
over for a drink. However, I cam across a rather
interesting one on a recent trip back to Asia and
after many 40m QSOs with VU2s -- many often said "I
must say 73 now and run for my modulation" One even
said "plate modulation" Had me confused for a while
until I realised that they meant "dinner" or simply
that they had to go have a "meal" !!!

BTW, I restored a T4XB a few years ago. It was left
idle in an outhouse for years and a famly of rats had
made a home inside! My first job was to hold the
garden hose inside and outside the rig! Try doing that
with an 850!!!

From: Bill K0ZL
Topic: 2599 Message: 2606

I use Krylon "Dove Grey" for much of my K'wood repainting. It's a little lighter than stock grey. You can find Kenwood color paint suppliers on the web.

Most important is to sand the scratched down, starting with a 220 grit paper and ending with 400. You can then polish out the sandpaper scratches with a piece of emory cloth.

This after removing all hardware of course.

The case must be clean. Choose a day with little or no wind and no leaves blowing around!

Clean the case with denatured alcohol. Wear a cheap pair of cotton gloves if you want to keep all fingerprints off.

Paint over newspaper or with the case piece suspended by bent coathanger. I like them flat on paper as this will help keep the paint from running if you over-spray.

Get the paint can "all shook up" (sorry Elvis) and spray test shot on paper first.

As you spray the piece, begin motion away from the piece, press on the valve to start the paint spray, then sweep it evenly across the piece, releasing the valve only after clearing the other side of the piece.

Slightly overlap sweeps but don't allow paint to accumulated too thick.

Paint one surface at a time and let it dry for 20 minutes before moving it.

You can paint one coat, let it dry, then paint the next coat; on the 2nd coat you should see a pretty good surface of wet paint, which will tend to smooth out any existing scratches.

After the second coat, put the piece in the oven at 200 degrees for about 90 minutes or until the paint smell is gone (best make sure Mom is gone, hi). Don't worry, paint fumes won't "stick" in the oven, just make sure you take the bird out of the area and provide plenty of ventilation. Let the piece cool in

the oven until you can touch it. You can dry as many
pieces as you have room for at a time.

When you get the piece out, make sure it is cool to
the touch. then you will notice that you cannot
scratch the paint with a fingernail; try this in an
inconspicuous place first. You will be amazed how hard
the baked Krylon finish can be.

2611. RE: [TS-520_820_530_830] Re: TS-530 Paint

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-10-30 14:34:51 UTC
From: Brian
Topic: 2599 Message: 2611

Well, if you're going to make an "official" file about it all, I've noticed that nobody mentioned humidity (definitely a concern for those in the south-eastern states, most of the year). If you paint an object (radio case, car part, etc) outdoors when the humidity is too high, you'll end up with an "orange peel" texture on the surface when the paint dries -- you'll see this effect on some "cheap" automotive paint jobs from time to time. The secret is to either paint indoors where you can control the humidity, or patiently wait for a day with humidity < 50% and temperature between 70 and 80 degrees Fahrenheit. I've painted a few car parts in my back yard this way, using DupliColor touch-up paint, and the result is indistinguishable from the factory paint job.

Obviously, if you're drying in the kitchen oven, humidity isn't a problem! Occasionally, though, you might find some plastic pieces that need to be painted, or perhaps the oven won't be available for paint drying ...

73 de AI4AI,
- Brian

I have aquired a TS-830S with the WARC bands still locked out.
The manual states there are diodes in place to prevent transmission
before FCC approval but gives no reference to where or what diodes.
How do i release the WARC bands for transmit?

Bill thanks but have solved my problem. I found that I had no RB2 on the IF board. RB2 provides the bias to g2 on Q3 and Q4. Resoldered pins on connector and that took care problem. I had a bit of a time with the connectors when I first removed the board, they were kind of tight and I believe I loosened up a bad solder joint.
Thanks for assist offer.....73,

Mack

Although I have one and have never used it for such, I have heard
that a convection oven makes the finish awesome, but I stand to be
corrected.

From: pchapman9202003
Topic: 2616 Message: 2624

I am not a good SME, There is typicaly a 10m falloff but do not know how much with that rig. 90 watts on 10 m can be better than a full gqllon elsewhere.

I am not sure there is a "normal" output. I have four KW tube rigs and
they are all different in output, but yes they all drop off on 10 meters.

2626. Re: TS-830S Power Output

Yahoo group: TS-520_820_530_830 (2001 — 2004)

Jim:
I have worked with 5 different 820s. I have not had any experience with 830 s but I think the PA is similar.

Typically the 820s run around 110 to 120 watts on 40 meters and around 90 on ten meters below 28.5. Above that they are a bit lower. Does yours have S-2001 finals or 6146 Finals? If it has 6146 finals the finals have probably been changed. If this is the case and you know how to do it, you may want to check the neutralization. This can be a bit tricky. I assume you are getting proper ALC when on SSB.

150 watts is very good!

Roll off on 10-12-15 meters is normal.

Login to the group; go to FILES then MODS.

d'load the file WARC BAND ENABLE FOR THE 530... same
for 830.

You will remove the bottom cover of the rig and cut
one wire at the AF unit, which is on bottom of rig,
right side. Face the ant connector up with rig on side
to access per the picture.

You will need heatshrink, or tape.

No it's more of a "spattering", not sure what the
paint afficianados call that. In house painting they
call it "knockdown" texture.

Hi Bill,
It is hard to believe but my TS 830 healed itself. The problem that I had of low output on SSB went away. The radio now works as good as before with about 100 watts output. I run about 50 watts on RTTY now though having learned my lesson. This is a 1987 radio and the tubes were never changed either the driver or finals.
Thanks again,
Aaron - WC2C

2638. TS 830s Band Switch Failure

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-11-01 14:47:46 UTC
From: ke4iza001
Topic: 2638 Message: 2638

Has anyone seen trouble with the band switch? I saw an article, granted from a repair shop, that the 520, 530, 820 and 820 were prone to band switch failure due to the OEM switches being defective. I myself have only read of this happening to one ham. I am kind or worried now. The TS-830S I bought is in mint condition although is has been in the original box stored in a spare bedroom closet for 8 years. The rig was tested and did 90w on 10m and 145w on 80m. Maybe I am just worrying for nothing. I am just wondering how common this problem was. I might believe Kenwood had a batch with bad switches but find it hard to believe all radios were this way.

Jim - ke4iza

2639. RE: [TS-520_820_530_830] TS 830s Band Switch Failure

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-11-01 15:21:38 UTC
From: Bob Mackie
Topic: 2638 Message: 2639

Hi Jim. How ya doin? Listen, don't worry about it unless you have a problem crop up. It sounds like you should have a fine rig there if it's been stored properly. It is possible that the control pots, switches, etc could use a little cleaning, but I wouldn't touch it unless you have a reason to. I've been a radio/communications tech for 32 plus years, and I've seen lots of fine equipment damaged and even destroyed (even by experienced techs) because all they wanted to do was "service" their fine-working equipment. Just using spray cleaner can cause major damage if you use the wrong type or use it improperly. My suggestion is If you don't have any scratchy, noisy, or intermittant control pots or switches then leave it alone and enjoy operating it. Remember, Don't Fix It If It Ain't Broke!!! Good luck and 73 W7ASH - Bob Mackie--- On Mon 11/01, ke4iza001 < generalemail@... > wrote:From: ke4iza001 [mailto: generalemail@...]To: TS-520_820_530_830@yahoogroups.comDate: Mon, 01 Nov 2004 14:47:46 -0000Subject: [TS-520_820_530_830] TS 830s Band Switch FailureHas anyone seen trouble with the band switch? Jim,
I haven't seen anything about a bunch of switches being defective. The most common bandswitch problem, other than dirty contacts, is that the nylon shaft coupler in the final area cracks, but they are still available from Kenwood and the fix is not too hard. You could examine it and see if it looks cracked and ready to fall apart.
Of course, all mechanical bandswitches will eventually wear out! When I had my 830, I did not change bands nearly as often as with my more modern rigs, with the intent of keeping it working as long as possible. The bandswitch in the 830 seems to be pretty rugged, though.
73,
Paul K4PDM

Well PTL for that! hi..

Suspect dirty relay contacts or bad solder joint
somewhere. If it comes back, you will know which one
it is.

Vy 73 and enjoy! Sounds like ten meters is open again
today (Monday) but everyone is at work. Except us.

Have not seen switch failures, but rather the plastic
flex coupling that resides just inside the PA cage.

Inspect it for cracks around the setscrew holes. If
you see any, replace the coupling. You will need a
1.5mm allen wrench. It's not hard to do but you have
to maintain band alignment as you rotate around to get
to all the screws.

Leave one set tight as you loosen the other. Then
rotate the band switch to get to the 2nd set. Note
which band you are on!

Loosen the 2nd set, then pull the bandswitch shaft
part way out the front of the rig. Use whatever tools
you need to wiggle the old coupling out of the hole in
the pa cage, and the new one in, noting which way your
setscrews should be oriented so you can follow the
same process going back together.

DON'T OVERTIGHTEN THE SETSCREWS! Snug them up and
then no more than a 1/4 turn again. It's plastic; it
will break if you treat it like a metal coupling.

I had this problem and I replaced the coupling in the
PA area with the coupling on the shaft outside the PA
cage.

Bill, where can one buy the exact replacement? I had
to use a sawn off part of a marker pen! It works but
not nice to look at.

Topic: 2637 Message: 2644

Hello again all,

I itroduced myself way back at message 1603 and have read everything since. I still do not have many minutes at a time to play with the radio but my sons and I just managed to get 12 radial wires into the ground for my vertical antenna, 4 each on three of the four directions, the house is in the way on the fourth. The yard is small enough that we had to bend them a bit to work but hopefully now I have them in for 10-40M. 80M was just too long of a wire to even think about doing.

Today I am taking the day off and will be working on my antenna again. In order to tune it I need to clamp a tap onto the base loading coil. Since this is a nuisance I have rigged a box with switches and am going to be soldering permanent switched connections, so hopefully, all I will have to do is to flip the right switch and then use my tuner to fine tune.

To update on my setup -

I started with a 520 SE (that came with a Kenwood MC-50 microphone) that I could not convince myself was working. Even though I could hear I was not able to get anyone to respond to me. I bought a second radio, a 520S that I wanted to use for field day, but it turned out that the SE worked great with a long wire dipole in our church parking lot. I was able to contact from Sacramento to the North to San Diego to the South and Arizona to the East, on 40 M. Right now both radios are sitting side by side, but the RF ground is hooked to the 520S. I was able to make one contact on 20M the other day so I at least know that something is getting out. I bought one of the (BOYB??? antenna analysers) and use that to tune the antenna. I just picked up an old B&W protax coax switch that I hope to use to connect both radios to the tuner/antenna without having to dig around on the back of the boxes to unhook the antenna wire. I just came up with a roll of braided wire that I am going to redo all of my grounding with.

I wanted to get a second microphone so that I won't be switching back and forth and decided from all of the discussions about Astatic D-104 and Hiel elements to try that route. The mike was a cheap as is and is turning into a project. Right now it's component pieces are all over my table and I am trying to figure out if the board is any good. The microphone element that came in it is trash, so it is just as well that I bought the Hiel element. (What do people use for filling up the extra space inside the microphone head?)

This was a very long winded way of saying that if I can get my box connected to my loading coil before about 2 pm PST I may try to make some 10 M contacts if the band stays open.

Keith,

KG6TPU

(I was trying to listen for Sean the other day when he was trying to get his station on the air but we missed on the timing, It sounds like he has been succesful though.)

Well PTL for that! hi..

Suspect dirty relay contacts or bad solder joint
somewhere. If it comes back, you will know which one
it is.

Vy 73 and enjoy! Sounds like ten meters is open again
today (Monday) but everyone is at work. Except us.

HI Keith,

well the band is open, but hardly any users.. all at
work in this hemisphere I guess!

Congrats on the ant work.

I am not going to make it on the air today. I have to leave now for an appointment and only have two stubs soldered onto my coil. Catch you later.

10 is cooking right now. From Chicago with a ground mount vert and 100-ish watts I worked Italy and Spain on USB (lot of activity from the contest) and Namibia on CW. I also heard a number of other European stations. Currently 11AM.

Jim,

I purchased my TS-830 used, I was the third owner, and four to five years later . I had to have the band switch replaced. I lost output on the lower portion of 10M.

Subject: [TS-520_820_530_830] TS 830s Band Switch Failure

Has anyone seen trouble with the band switch? I saw an article, granted from a repair shop, that the 520, 530, 820 and 820 were prone to band switch failure due to the OEM switches being defective. I myself have only read of this happening to one ham. I am kind or worried now. The TS-830S I bought is in mint condition although is has been in the original box stored in a spare bedroom closet for 8 years. The rig was tested and did 90w on 10m and 145w on 80m. Maybe I am just worrying for nothing. I am just wondering how common this problem was. I might believe Kenwood had a batch with bad switches but find it hard to believe all radios were this way.

I have owned a TS-820S since 1979. I ran it as my primary HF rig until 2001. The problem I had with the band switch was that the nylon band switch shaft coupling that connected the band switch shaft in the main part of the rig and the shaft in the final compartment split. I managed to repair it by installing a cable tie around the OD, but it really should be replaced. This is like a 5 dollar part, but you have to take off the front panel and some various other things to do the job, which is a major effort.

It turned out to be the perfect excuse to upgrade to an Icom IC-756PROII. Anyhow, I am going to get the rig fixed someday, just need the time and motivation to do it.

Robert,

I have to admit that I don't know what the power output of my TS-530SP is as I don't have a wattmeter. I would sum it up as "adequate"! I can get 250mA of plate current so that's about 200W input and hopefully about 100W out. The weakness of my station is the antenna - choice of a 20m dipole up at 12 feet or 60 ft long(??) wire up at 6 ft! Still I have managed QSOs in all continents in the past few weeks.

The instruction manual that was supplied with my rig has a note on the front page to the effect that it covers both the TS-530SP and the TS-530D.

Keep us posted on how you get on with the TS-530 when it arrives, and in particular whether it is an /SP or a /D

2650. Re: TS530SP HELP!!!!

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-11-03 07:39:08 UTC
From: Robert
Topic: 2575 Message: 2650

Hi Richard,

Well, I received the rig today via UPS. It is a 530SP. The guy who sold it to me said it was in "perfect mechanical and electrical condition". The pic looked cosmetically good, which it is. BUT... within 10 minutes of taking it out of the box I ascertained:

-The VFO was not smooth, dragging against something (inside?)
-The VU meter did not light
-There was no movement at all of the VU meter
-The band switch just moved freely, without any click or stopage at bands(but you could hear individual bands)
-The audio on all bands was distorted on strong signals
-80 meters was just very loud hash, no signals readable

This is of course a huge disappointment!! I called the gentleman (seller) and he was very suprised and told me it was in perfect working order when he shipped it. I told him the shipping box was in perfect shape when it reached me. He said that UPS 'must' have dropped it. I told him I wanted to send the radio back, as it was far from what was represented to me. He insisted it was UPS's fault and said he'd call me later after he made a claim with them.
Two hours later he said UPS would have nothing to do with it. Then he started asking me 'what I had done with it'. To make a long story short he was trying to blame anyone but himself. He finally, after my point was expressed many times, said I should pay for shipping it back to him, his Paypal fee's, and half his shipping cost...then he would refund the $300 I paid!

There was NOT even slight damage to the shipping boxes and NO signs of "accordian" type damage to the bottom of the box. I am not an expert on Kenwood radio's but I worked in shipping for many years and this was NOT damaged in shipping.

Any Idea's? Any help or suggestion's from the group would be helpful.

Thanks,

Robert

Robert,
I don't have much help on the rest of it but when my second radio came, from a fellow who had just had it adjusted and etc by a Kenwood store, the VFO was completely stuck. I assume it got bumped in transit somehow. I took the knob off and found that the screws were readily accessible. I was able to loosen them slightly and free it up. I was surprised at how little there was behind the knob. Good luck.

Keith

Subject: [TS-520_820_530_830] Re: TS530SP HELP!!!!

Hi Richard,

Well, I received the rig today via UPS. It is a 530SP. The guy who sold it to me said it was in "perfect mechanical and electrical condition". The pic looked cosmetically good, which it is. BUT... within 10 minutes of taking it out of the box I ascertained:

-The VFO was not smooth, dragging against something (inside?)
-The VU meter did not light
-There was no movement at all of the VU meter
-The band switch just moved freely, without any click or stopage at bands(but you could hear individual bands)
-The audio on all bands was distorted on strong signals
-80 meters was just very loud hash, no signals readable

This is of course a huge disappointment!! I called the gentleman (seller) and he was very suprised and told me it was in perfect working order when he shipped it. I told him the shipping box was in perfect shape when it reached me. He said that UPS 'must' have dropped it. I told him I wanted to send the radio back, as it was far from what was represented to me. He insisted it was UPS's fault and said he'd call me later after he made a claim with them.
Two hours later he said UPS would have nothing to do with it. Then he started asking me 'what I had done with it'. To make a long story short he was trying to blame anyone but himself. He finally, after my point was expressed many times, said I should pay for shipping it back to him, his Paypal fee's, and half his shipping cost...then he would refund the $300 I paid!

There was NOT even slight damage to the shipping boxes and NO signs of "accordian" type damage to the bottom of the box. I am not an expert on Kenwood radio's but I worked in shipping for many years and

this was NOT damaged in shipping.

Any Idea's? Any help or suggestion's from the group would be helpful.

Thanks,

Robert

From: peter A markavage
Topic: 2575 Message: 2652

I would notify Paypal about the situation. If you present the facts as you stated here, see if Paypal can step in and resolve the problem. Paypal many times will rule in favor of the buyer. Keep all the e-mails between you and the seller. Buyers generally have more leverage than sellers.

2653. TS-530SP - Help

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-11-03 08:14:59 UTC
From: Richard Harris
Topic: 2653 Message: 2653

Robert,

I was very sorry to hear that you received a rig with so many problems. I don't have much experience of the insides of the 530 but there will be others in the group who can advise. I do have a copy of the Service Manual and can help with information about how to take the unit apart as well as all of the schematics and set-up information.

I hope that you are able to get a refund from the previous owner and can get another good example of the breed - they are excellent rigs. Otherwise you have given the group a challenge to help sort it out.

Keep us posted.

73s

Richard G3OTK

At 07:39 03/11/2004 +0000, you wrote:

Hi Richard,

Well, I received the rig today via UPS. It is a 530SP. The guy who sold it to me said it was in "perfect mechanical and electrical condition". The pic looked cosmetically good, which it is. BUT... within 10 minutes of taking it out of the box I ascertained:

-The VFO was not smooth, dragging against something (inside?)
-The VU meter did not light
-There was no movement at all of the VU meter
-The band switch just moved freely, without any click or stopage at bands(but you could hear individual bands)
-The audio on all bands was distorted on strong signals
-80 meters was just very loud hash, no signals readable

This is of course a huge disappointment!! I called the gentleman (seller) and he was very suprised and told me it was in perfect working order when he shipped it. I told him the shipping box was in perfect shape when it reached me. He said that UPS 'must' have dropped it. I told him I wanted to send the radio back, as it was far from what was represented to me. He insisted it was UPS's fault and said he'd call me later after he made a claim with them.
Two hours later he said UPS would have nothing to do with it. Then he started asking me 'what I had done with it'. To make a long story short he was trying to blame anyone but himself. He finally, after my point was expressed many times, said I should pay for shipping it back to him, his Paypal fee's, and half his shipping cost...then he

would refund the $300 I paid!

There was NOT even slight damage to the shipping boxes and NO signs
of "accordian" type damage to the bottom of the box. I am not an
expert on Kenwood radio's but I worked in shipping for many years and
this was NOT damaged in shipping.

Any Idea's? Any help or suggestion's from the group would be helpful.

Thanks,

Robert

Hello Robert,

what you described is a problem with the Bandswitch,
what is well known with the TS830/530.
What is very importnant do not!!!!!!!!!! transmit with the rig
with this problem.
There is a isolation piece between the first part
of the bandswitch and the second part, what is in
the case where the final tubes are. The two parts are not synchron
when this isolation piece is broken.The second part holds the position
off the complet switch so now you could rotate it where easily.
If you open the upper case you will see the problem.
You follow straight the switchaxis and you see the
isolation piece.It is not very expensive and other hams will know
where to buy it in the United States.
What is very important to find out what position the second part off
the switch has now to make both parts synchron otherwise
the tubes are mismatched and could break.
By the way I think it could not happen during transport.

good luck and success from Germany

Kay DL5OAQ

Robert:

It has been a long time since I have seen a 530 but I have some ideas. When I get done with this everybody on this site will know how crazy I really am but I wanted to share with you a wild guess.

Sounds like the S meter not working and the distortion on receive with strong signals as well as the loud hash on 80 meters could all be related. Sorry but I have to ask, is the AGC switch in the off position by chance? If it is, turning it on may be all it takes to fix these problems.

The following description may not be exact as I am trying to picture something I worked on several years ago.

The band switch should have a mechanism inside the front panel that has a steel ball much like a ball bearing and a flat spring that is a piece of spring steel. A gear like mechanism should be located on the shaft. The ball rests in-between two teeth of this gear like mechanism held in place by the steel spring. When the band switch is turned, the ball is pushed up over a tooth and drops into the next space on the gear-like part holding the band switch in the next position.

Now, this may seem real far out, but it is possible that the ball or some part has gotten out of the switch mechanism and is lodged in circuitry shorting out the AGC or perhaps lodged inside the AGC switch itself.
It may come rolling out. If it is missing from the switch look for it.

It is also possible that if the AGC problem was the AGC being switched off, the ball may have gotten into the VFO mechanism resulting in the dragging.

Oh by the way, I cannot remember if the AGC switch is a togle switch butit too may use a ball. Don't dig the wrong one out!

The meter light is a filament type light and often goes out by slight jostling when a radio is carried from one place to another. How often do service people have to hear the complaint " the light
was
working before I brought it in"? It is also possible that the switch mechanism I described above came apart due to rough treatment while being shipped, but not bad enough to damage the packaging.

Now I am really going out on a limb for a very long shot here but this is the first thing I would look for if this radio were on my bench.

What kind of e bay feedback did this seller have? Of course there is a problem with guys getting rid of junk this way. When dealing with large sums, I think e-bay has a system that works like a middleman who holds the money until you receive delivery of the item and assure it is satisfactory. Maybe somebody knows more about this.

In any event see how it looks inside. It may well be worth fixing.

Robert:
I saw the message from Kay DL5OAQ after I posted mine. Looks like
the locking mechanism is in the back and the shaft is the problem.
Like I said it has been a long time since I have worked on a 530 but
I tried! Unless it too is somehow related to the bandswitch, you may
still suspect the deas S meter and overload to be an AGC problem.

Thanks Kay ! I'm glad someone came along with better info.

In addition to the AGC, ensure the NB is not turned up
too high.

It could very well be that you dealt with a dishonest
guy tough. I know how it feels....I was cheated by a
guy in Greenbay, WI, who sold me (the DX station) an
ailing Kenwood. He is a well known contester and
seemed to have a decent reputation! It is not always
only a guy in Nigeria or Bulgaria who cheats you!

Good luck!

I would not do anything to this rig until the dispute
is resolved. There is far too much wrong to be
shipping damage.

Hi Robert,

Well if you bought the rig via Ebay, a threat of
negative feedback and possibility of contacting ebay
regarding fraudulent claims by a seller might help.
Always try to work with the seller.

If you paid via Paypal, there is some buyer protection
there also; contact them.

If you paid via credit card, photocopy everything and
call your CC issuer to dispute the claim. They will
put a back-charge on the sellers merchant account and
the seller will not get his money until the dispute is
resolved.

Did you have a witness to the condition of the radio?

hi just a thought but quite a few of the symptoms mentioned (other than bandswitch) could just be AGC switch off?

Well....yes the AGC switch did take a few of the problems away. I used to have an 830 briefly and the AGC did not work like this one. It must have been faulty, or the 830 is different. But I did find this out late last night as I switched around. So thank very much for that suggestion which solved the VU/Audio overdrive problem. You guy's are on it quickly!
The bandswitch, VU light and a loose blue wire down near the VFO are my only concerns now. I just got in from work and as I was reading through all of your emails I think I've decided to just fix these problems and live with this particular gentleman's inaccuracies.
I think I need to fix the bandswitch first...to be sure I can check out the tx power output.
Thank you all for the quick response and excellent suggestions. I'll reread them now.

Robert

OK Robert
Look at the coupling from the bandswitch shaft leading
into the PA cage. It may be loose, or broken.

You will need some way of making sure that the rear
part of the switch which selects the PA tank tap for a
particular band, is synced with the front part which
does everything else (RF amp, driver grid, driver
plate). Otherwise you will see no power out and the
tank ckt will not dip on the right band.

Hi everyone,

I recently purchased a Kenwood TS-520 in good shape. I am looking for a pair of the "extension feet" and screws used to elevate the front of the radio. Anyone have what I am looking for?

If so, please email me at: w2byo@...

73,

jRay/W2BYO

Bill,

I opened up the cage and removed a 6146B(frontside) and can easily see that the white connecter immediately inside the cage is broken. So nothing is being selected in the tank circuit, evidently. It looks like it would be pretty difficult to get to the part that's broken...??

Thanks,

Robert

Robert:

The loose blue wire is a wire, when cut, enables the WARC bands on the radio. Tie it into the cable bundle with a ty-wrap and "don't sweat it"....

From: Bill K0ZL
Topic: 2664 Message: 2668

When you change loading, that always causes the plate current to change. It will also slightly change the resonant point of the plate tuning cap, because it all interacts. Think of the tune and load controls as an antenna tuner for the tubes. You are trying to effect a "match" between the tube anode circuit and the antenna for maximum power transfer.

You should see maximum power out with a LOAD setting that will give you about 10-12 percent plate current DIP on the TUNE control. As you rock the tune control back and forth, you may see it up to 260 mills on either side of the dip, and 230 mils on the dip; this is different for each radio and each antenna.

If the dip is too deep, the impedance of the tubes is not matched to the antenna and the plate circuit is said to be "under loaded". Maximum power is not transferred to the load (antenna) from the transmitter. Plate dissipation is increased. Tube life is decreased.

As you advance the LOAD control, the dip becomes less and less deep; past the 10-12 percent mark, when the dip becomes nearly indetectable, the circuit is said to be "over loaded" (more clearly, "overly loaded") and again, the plate circuits are not matched to the antenna impedance. Again, maximum power is not transferred to the load (antenna) from the transmitter. Plate dissipation is again increased, because the circuit is now much less efficient in getting the power generated by the anode circuit out to the load; tube life is decreased.

Don't take long when doing this, and always end the transmission in the "dip" to minimize plate dissipation. Always "play" into dummy load if possible to keep your carrier from interfering with others and to reduce the effects of SWR on tuning which can confuse things, when you are learning.

I am able to match my G5RV which has 2:1 swr on all ham bands, using this method with my Valiant which has the same type of matching circuit. I don't use a tuner with any of my tube rigs; the plate tank circuit is the tuner!

Bill,
In all my years of radio I have never before seen an explanation of "under loading." I had heard the term and seen it in literature, but never knew for sure what it was. Thank you so much!

2670. No RF Output or PWR on a Kenwood TS-530s

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-11-04 16:03:10 UTC
From: kc8jhy
Topic: 2670 Message: 2670

I own a Kenwood TS-530S. When I try to tune the transmitter I receive no RF output on the meter, when I try to dip the plate current the meter shows absolutley no deflection at all. I can't get any forward power on the tuner meter. The bias shows 60mA and the HV is OK. ALC is OK.

The SG is turned on, the RF pot is turned all the way up. I swaped out all the tubes with a spare set.

Recently I broke off the lead from one of the cups that fit on top of the 6146's. I resoldered it and it seamed to be Ok. Now this happened.
Any ideas.

Thanks,

Tom KC8JHY

What's really strange is that when under-loaded or
with the dip too deep, the loading cap is fully
meshed; just the opposite of what one might expect!
hi.

when you are tuning, you get nothing morre than idle
current at any time?

This would be a broken wire at the top of the plate
choke; you probably broke it when you fixed the tube
cap.

Just unwind it a couple of turns and strip the enamel
off with a sharp knife, and re-solder it to the top
connector on the plate choke. Stay away from the
parasitic suppressor leads; you don't want to have to
unsolder the thin wire to change them later if needed.

be careful; hv will kill you.

I just got a TS-830s to sit beside my 520s and 700sp.
Looks like my classic Kenwood collection is beginning to grow.

Did they change the color of the Kenwood emblem on the 830's ?
This one has a gold Kenwood emblem but the face and everything else what I would expect as normal.

There is zero difference between a gold emblem rig and any other color emblem. If someone tells you there is, it's a myth. It's a bogus sales pitch used by some sellers.

You can get a huge jolt touching the anode cap even
half hour or more after switching the rig off. Make
sure you bleed it to ground before working on the rig.

Hello Robert,

well decided. He is the looser and
you are the winner.Off course you gave good money
and received a bad rig, but your knowledge grows with every fixed
problem, and at the end you love your rig because you know a lot
about it. I have made this experience several times and it is not
right what the seller has done but I am the winner not he,hihi.

73 and all the best and good luck

I have seen caps for the bottom of walking canes. If the right size, they can slide over the existing feet. Ace hardware has these. Also they have specialized hardware in cardboard drawers by Hillman. Round rubber rollers and things.

Probably not an issue when you are in "tune" position.
Might be a good idea to see if there is drive?

73,
Ron

Regarding Bill's last paragraph:

Then there's those of us who use an antenna fed with 450 ohm ladder line. Too bad the radio's "tuner" can't tune my antenna. I am left with tuning the radio's tuner and the antenna tuner's tuner. Argh! Too many knobs!!!!

Eric

Bill K0ZL <coorsbill@...> wrote:
When you change loading, that always causes the plate current to change. It will also slightly change the resonant point of the plate tuning cap, because it all interacts. Think of the tune and load controls as an antenna tuner for the tubes. You are trying to effect a "match" between the tube anode circuit and the antenna for maximum power transfer.

You should see maximum power out with a LOAD setting that will give you about 10-12 percent plate current DIP on the TUNE control. As you rock the tune control back and forth, you may see it up to 260 mills on either side of the dip, and 230 mils on the dip; this is different for each radio and each antenna.

If the dip is too deep, the impedance of the tubes is not matched to the antenna and the plate circuit is said to be "under loaded". Maximum power is not transferred to the load (antenna) from the transmitter. Plate dissipation is increased. Tube life is decreased.

As you advance the LOAD control, the dip becomes less and less deep; past the 10-12 percent mark, when the dip becomes nearly indetectable, the circuit is said to be "over loaded" (more clearly, "overly loaded") and again, the plate circuits are not matched to the antenna impedance. Again, maximum power is not transferred to the load (antenna) from the transmitter. Plate dissipation is again increased, because the circuit is now much less efficient in getting the power generated by the anode circuit out to the load; tube life is decreased.

Don't take long when doing this, and always end the transmission in the "dip" to minimize plate dissipation. Always "play" into dummy load if possible to keep your carrier from interfering with others and

to reduce the effects of SWR on tuning which can
confuse things, when you are learning.

I am able to match my G5RV which has 2:1 swr on all
ham bands, using this method with my Valiant which has
the same type of matching circuit. I don't use a
tuner with any of my tube rigs; the plate tank circuit
is the tuner!

2694. RE: [TS-520_820_530_830] WTB TS830S IF Board

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-11-05 01:06:33 UTC
From: DW
Topic: 2517 Message: 2694

Two points, & apologies for being so late in replying.

First, yes, please do post any problems that you've experienced in your "Kenwood Careers gang. Some of us are still either new to the hobby, or new to HF, or new to old Kenwoods. Your experience, even if embaressing to tell, may well help one or more of us from the same embaressment. I promise, I will not laugh.

Secondly, as someone who is indeed on a fixed disability income, it is very saddening to hear of someone profiteering through lying about the same. The only reason that I have a fine TS-520 is because of a friend from my former club 600 miles away was kind enough to donate his rig to me when he updated. Let's all try to remember that many of us really are in some sort of need, and that a helping hand is truly appreciated. Those who would make a profit through falsehood will truly reap what they sew, ie: What goes around comes around...and it picks up speed on the way back.

2695. Re: [TS-520_820_530_830] A new to me Kenwood....

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-11-05 01:50:42 UTC
From: peter A markavage
Topic: 2675 Message: 2695

There were only 4 or 5 service bulletins issued by Kenwood for the entire life of the 830. None of them were of any major circumstance. Whether any of the changes were added to production sets and some Kenwood physical design engineer decided to use a different colored emblem to distinguish "changes in" vs "changes not in" is just pure speculation. Kenwood tracked their rigs by serial numbers not by the color of an emblem. The only major 830 anomaly was the addition of the 830M which was an 830 with an AM position and a 6 KHz wide filter. Never sold here in the U. S. but the service manual covers both models.

Pete, wa2cwa

On Thu, 4 Nov 2004 09:59:20 -0800 (PST) akshay daniel <danielakshay@...> writes:

Pete, might it indicate a later production batch?
I have seen people touting 830s as "Gold emblem" !
Yeara ago, I had two 830s -- one of each. As yous say,
no dif at all but I do wonder if one was older (or
newer!) than the other?

Try placing a four to one balan in between the balanced line and the antenna.

I seem to remember that I tried that once, unsucessfully. Perhaps its worth another try, however. I will report back to the group on my results.

That's why I posed the question in response to Eric's statement "Too bad
the radio's "tuner" can't tune my antenna. I am left with tuning the
radio's tuner and the antenna tuner's tuner. Argh! Too many knobs!!!!"

None of the rigs on the market today with built in antenna tuners can
tune open-wire line effectively to achieve maximum radiated power from
the antenna.

The beauty of an antenna fed with open wire line is that it becomes a multi-band antenna when fed with a antenna tuner. Since Eric has already connected his open wire line to, I'll assume, the two balanced antenna connections on his tuner, he already has a 4 to 1 balun connection made. The tuner tunes out the reactance between the unbalanced section of the balun and the rig as you change from band to band. If you remove the tuner and just use a 4 to 1 balun at the antenna terminals, the input to the balun can be fed with coax. However, you effectively have converted your multi-band antenna to one band cut for some frequency that may or may not resonate in any amateur band. Putting the 4 to 1 balun down at the station is no different than connecting the open wire lines to the back of the tuner and just not adjusting any of the controls. Bottom line is, if you use open wire lines as your feed to the antenna, you need to use an antenna tuner.

If you don't want to use a tuner, then put up dipoles or inverted vee's or some derivation of both, cut for the band or bands you want to operate, and feed them with coax. If you do it correctly, you don't need a tuner.

Pete, wa2cwa

2705. Balanced line and Balun

Yahoo group: TS-520_820_530_830 (2001 — 2004)

Topic: 2705 Message: 2705

With a tube type transmitter that has a matching network such as a pi network, the only difference between the radio itself and the radio with a tuner is that the radio alone cannot handle as wide a range of complex impedance as the tuner.

If the tuner has a 4 to 1 balun built in, it can handle a balanced line within its range of complex impedance's. If a radio has a 4 to 1 balun between it and a balanced line, it can handle a balanced line within its range of complex impedance.

I agree that the likelihood of the impedance being outside the range of the radio and a balun is greater than it would be with a tuner. If the balanced line antenna with the complex impedance divided by 4 would happen to fall with the range of the radio alone, the tuner would not be necessary.

I disagree that this is the same as using the tuner "but not turning the knobs". The inductors and capacitors in the tuner will still be in the circuit set to a random value causing problems.

Of course, if you happen to have a tuner that leaves the balun in line in the bypass position, then you could use the tuner as a stand-alone balun, but most tuners do not work this way.

Just at these transmitters sometimes will load directly into a coax fed antenna that does not have a good match, and sometimes won't, they will also sometimes load into a antenna fed with balanced line through a 4 to 1 balun, and sometimes they won't.

The original goal here was to eliminate the inconvenience of the tuner if possible.

Some bands This may work on some bands and may not on others.

If you need to use the tuner on some bands and not others, put the 4 to 1 balun between the balanced line and the coax input of the tuner. Set the tuner to bypass when you don't need it. Set it for coax input when you do. You will be using your external balun instead of the one in the tuner.

Hello Bill,

unfortunately I am not so good in
making lemonade,but if you are interested
in some fotos of the bandswitch I could make some
over the weekend.I think I am right that the TS830S
wich I use here and the TS530SP are identical in this
area.And a foto may help Robert to find out the
right position of the switch.

You might want to experiment a little. I am using a 400-foot-long center
fed Zepp, fed with ladderline, thru a 9:1 balun. My 830 would tune into it
with no problem, as will my amp, as will the autotuner in my 850.
I think the 9:1 ratio makes the difference.
73,
Paul K4PDM

I would try a 9:1 balun and see if you can work into
your antenna without a tuner.

My balun is a homebrew, 4:1 or 9:1 balun made with stacked toroids and some pretty hefty wire. Should handle any voltages that a 100-watt radio might generate.

As indicated in another reply to this thread, I can do 9:1!!!!! If I can find the darn thing (we moved from Ohio 4 months ago), I'll try it out this weekend and let you know how it works.

Eric

You might want to experiment a little. I am using a 400-foot-long center fed Zepp, fed with ladderline, thru a 9:1 balun. My 830 would tune into it with no problem, as will my amp, as will the autotuner in my 850.
I think the 9:1 ratio makes the difference.

From: Eric Webner
Topic: 2664 Message: 2714

I would be interested in knowing how it was done "way back when." In the '30s, '40s and '50s guys did they generally use antenna tuners, or just their transmitters?

My first rig (back in 1979) was a Johnson Viking Ranger, single 6146 final, fantastic pi-network (akin to Johnson's Matchbox) and I expect it could load about anything.

I have used balanced-fed antennas for many years. For multiband work and effectiveness, they just make sense. But can I reduce the time it takes to tune up on frequency?

Just remember the input side (looking at the transmitter output)
impedance should be fairly constant over the frequencies of interest.
Bumps here will generate heat and standing waves back to the transmitter.
The output side (balanced side) should have equal currents and 180
degrees out of phase with each other.

From: peter A markavage
Topic: 2722 Message: 2722

Way back when, many transmitter outputs used link coupling. Simply, there was a link facing the output tubes and an identical coil on each side of the link. The identical coils had taps on them and each side of your balanced line would connect to one of the taps. Each balanced line normally had an RF ammeter in series with it and you would manually connect to the taps until you got maximum and identical output in each RF ammeter. Along with the tap adjusting, you also had at least two variable capacitors, one generally a split-stator type, to resonate the final tank circuit for maximum power output.

Your correct. The Ranger had a pi-network output and claimed 50 to 500 ohms output impedance. However, for balanced line type feeders, they recommended their Matchbox. The Matchbox was not a pi-network tuner and bears no similarity to the Ranger output circuitry. The Matchbox circuitry consisted of a inductive parallel resonant network, coaxial wound coupling link, a dual tuning capacitor, and a dual differential matching capacitor.

To reduce time in tuning the rig and tuner for your various bands of interest, make a tuning chart. Do the tuning and band to band setup for maximum power output and minimum SWR and record the various knob settings on a chart. The next time you don't have to diddle with every knob. Just return the various knobs to what you recorded on the chart for the band that you want to operate on.

From: Bill K0ZL
Topic: 2664 Message: 2724

The Johnson Matchbox was about the best store-bought solution to the single or balanced wire feed. I had one and it tuned up pretty quickly.

There are a couple of balanced wire tuners on the market today that are based on that same design, if you have the budget for them.

The older transmitters used what is called "link coupling"... you would position a couple-turn link coil in the axis of the plate tank coil, ideally right in the middle of it (the tank coil would be wound with a gap in the middle for the link coil to fit). You would then vary the loading with the position of the link coil relative to the tank coil.

Selecting balanced or single wire feed was then simply a matter of grounding one end of the link coil, or not.

The disadvantage to the link coil design is that it was not a low-pass filter, as is the pi-network; that is why the popular pi-network supplanted link-coil design. Pi-networks were also less expensive to manufacture. Also pi-networks are much smaller than the typical link-coil arrangement.

Thanks, Pete, lots of good information here.

By your remarks, I was under an incorrect impression that the Johnson transmitter and tuner shared a similar circuit. Guess it makes sense, because two pi-nets would be redundant.

Anyway, this is getting away from the focus of the group. I suppose my interest is in using the Kenwoods that we love so much, but have them be simple to operate, like the newer rigs.

Eric

peter A markavage <pmarkavage@...> wrote:
Way back when, many transmitter outputs used link coupling. Simply, there was a link facing the output tubes and an identical coil on each side of the link. The identical coils had taps on them and each side of your balanced line would connect to one of the taps. Each balanced line normally had an RF ammeter in series with it and you would manually connect to the taps until you got maximum and identical output in each RF ammeter. Along with the tap adjusting, you also had at least two variable capacitors, one generally a split-stator type, to resonate the final tank circuit for maximum power output.

Your correct. The Ranger had a pi-network output and claimed 50 to 500 ohms output impedance. However, for balanced line type feeders, they recommended their Matchbox. The Matchbox was not a pi-network tuner and bears no similarity to the Ranger output circuitry. The Matchbox circuitry consisted of a inductive parallel resonant network, coaxial wound coupling link, a dual tuning capacitor, and a dual differential matching capacitor.

To reduce time in tuning the rig and tuner for your various bands of interest, make a tuning chart. Do the tuning and band to band setup for maximum power output and minimum SWR and record the various knob settings on a chart. The next time you don't have to diddle with every knob. Just return the various knobs to what you recorded on the chart for the band that you want to operate on.

writes:
I would be interested in knowing how it was done "way back when." In the '30s, '40s and '50s guys did they generally use antenna tuners, or just their transmitters?

My first rig (back in 1979) was a Johnson Viking Ranger, single 6146 final, fantastic pi-network (akin to Johnson's Matchbox) and I expect it could load about anything.

I have used balanced-fed antennas for many years. For multiband work and effectiveness, they just make sense. But can I reduce the time it takes to tune up on frequency?

73,

Eric

peter A markavage <pmarkavage@...> wrote:
That's why I posed the question in response to Eric's statement "Too bad the radio's "tuner" can't tune my antenna. I am left with tuning the radio's tuner and the antenna tuner's tuner. Argh! Too many knobs!!!!"

None of the rigs on the market today with built in antenna tuners can tune open-wire line effectively to achieve maximum radiated power from the antenna.

Pete, wa2cwa

The bottom line here is that these rigs 520, 820, 530, 830, 599 Twins, etc. are real work horses. With their pi-network design, they can be made to work with a wide variety of antenna designs and feeds, and perform very well. My Twins and 830 have been perking along for about the last 25 years with a minimal amount of maintenance and still perform very well. The Twins are one of my favorite AM rigs.

I would be interested in knowing how it was done "way back when." In the
'30s, '40s and '50s guys did they generally use antenna tuners, or just
their transmitters?

My first rig (back in 1979) was a Johnson Viking Ranger, single 6146
final, fantastic pi-network (akin to Johnson's Matchbox) and I expect it
could load about anything.

I have used balanced-fed antennas for many years. For multiband work and
effectiveness, they just make sense. But can I reduce the time it takes
to tune up on frequency?

Eric

peter A markavage <pmarkavage@...> wrote:
That's why I posed the question in response to Eric's statement "Too bad
the radio's "tuner" can't tune my antenna. I am left with tuning the
radio's tuner and the antenna tuner's tuner. Argh! Too many knobs!!!!"

None of the rigs on the market today with built in antenna tuners can
tune open-wire line effectively to achieve maximum radiated power from
the antenna.

From: tetrodehead
Topic: 2730 Message: 2730

WHEN it arrives, my TS-820s will be connected via 50ohm coax to a resonant half-wave dipole.

Will the Tx still see 50ohms looking into the coax if the dipole has reactance(?) caused by coupling to adjacent structures? (like only 20' off the ground with a steel-reinforced concrete pylon at one end)

Will the dipole Z still be 50 but not purely resistive or will the Z be different?

Will the Tx see only the coax Z, or the Z of the coax/dipole comination or just the dipole Z?

Apart from matching Tx to coax, can a 'tuner' tune-out antenna problems at the coax/dipole end?

Flat dipole in space is about 73 ohms...

Inverted vee gets ya closer to 50 ohms.

Closer to the ground? dunno

If one of the high voltage caps fails, typically you
will see 1/2 of the normal plate voltage or about 430
volts. And a lot of hummmmmmm.. guys will complain
that your audio is distorted and you will only get
about 30 watts out.

When you say it "won't transmit properly", what
exactly do you mean? Describe.

Don't know about the 530S, but in the 830S, there are
a pair of 100Mfd/450V filter caps in the HV supply. It
is possible that these are the culprits. About the
ONLY problems I have had with my 830S (bar those
related to operator stupidity!) have been with those.

2741. TS-830S Hum in audio

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-11-08 00:42:30 UTC
From: au20061
Topic: 2741 Message: 2741

I have been getting reports of a slight hum in my audio. It is not real bad but is detectable when I pause while speaking. The rig loads up great...puts out full power... and receive is right on.

I have tried different mikes....same problem. The receive audio is perfect..no hum.

I had another problem with vfo drift of 1 to 2 kc random. I tightened all the circuit board screws and it seemed to have corrected that problem. Still need to get rid of the transmit hum.

Any ideas?

Thanks

Tom K4KFN

Sometimes the connectors on the interconnecting cables can work loose. My 830 did this when the connector from the mic gain pot was slightly loose on the circuit board it goes to. Haven't had the 830 for a couple of years, but I think that is what happened with mine. Make sure all the connectors are fully seated.

Can you get the pole a bit higher? If not then do your best to keep the twinlead outdoors. It has to drop down perpendicular to the tophat but it can swoop upward to the poit where it enters the house.
The better bet is to raise the antenna. It is only a wire and does not requir a heavy duty support. If you could install wall brackets on the house and a section or two of mast will work FB. Put a small pulley at the top to raise and lower the antanna.

Hi James,

Just keep the balun off the ground. I am going to
mount mine on the outside wall just under the eve. The
twin lead can droop down before going up to the
antenna; if the ground is dry it can even lay on the
ground. Main thing is that the twin lead part is
perpendicular to the antenna wires.

Wow, Bill. That is very scary. Now if the guy doesn't believe us two mad scientists I don't know what he's going to do. hihi.

Just because more than one person says it doesn't make it right but in this case that is the right way to install an antenna with twinlead.

Actually, most guys use a G5RV because they hear about them but in reality if they took a dipole of any length and fed it with 450 ohm twinlead to a 4:1 balun and ran coax to the balun outside the house, they could have a very effective antenna for all bands.

I recommend the book "Lew McCoy On Antennas" published by CQ Communications. It is the best $16 you will ever spend.
http://unix8.sunserver.com/cq/Detail.bok?searchpath=d02a6c0810018d3444ee8&category=Books&start=1&total=48&no=24
This is described on page 43 of the book.

Looking back, it appears that the problem was intermittent at brief intervals. On the air reports were: "You got something cutting out." and, "Your signal is motorboating."..... etc. When I switch the meter over to "Voltage" it reads only 50 or 60% of what it should be.

From Eham.net Elmer Forum

http://www.eham.net/forums/Elmers/77523

Dear All,

I have a little problem with my gorgious Kenwood TS-530SP - yes when he dies I will buy a Ten Tec but until then ....

The problem: When I switch him on he either shows (switched on 20m) 13.500 Mhz or he shows the real frequency but behind 14.200 Mhz he starts to count back !!! Nice feature ... The real rx and tx frequency is a s displayed on the mechanical scale but the digital frequency display shows odd things or counts backwards.

Can anybody broaden my life again ??

Cheers

Lutz, DD1ZH

Paul

I just concluded a contact on 40 meters with a W7 in Utah. He gave me a clean audio report. I was 10 over 9 so hopefully I was strong enough for him to detect the hum if it was still there. I will keep my fingers crossed that the small connector was the problem.

Thanks for your help.

Tom,
Hope your problem is solved! You might also try listening on the "monitor"
circuit thru headphones. But the first thing I do with any older Kenwood
when there is a problem is check all those connectors!

2755. Re: [TS-520_820_530_830] G5RV antenna

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-11-09 02:20:49 UTC
From: Steve Phillips
Topic: 2743 Message: 2755

I just bought a G5RV as well. It's the WA2NAN True-Talk - II variety. It's 204' long. I was expecting the 102' version.

I strung it up temporarily in some trees but not high enough for the ladder line to all be in the air. Part of it is running along the ground at the moment.

I did some quick testing and easily tuned it with the tuner on 20, 40 and 80 meters.

I have heard that the balun is unnecessary. In fact the documentation that came with mine says as much and goes on to say that it's because the input impedance to the feedline is between 50 and 60 ohms.

Thanks,
Steve

On what frequency? The regular 102' G5RV is made to be a 3/2 wave antenna on 20m.
In order to prevent the coax from radiating the balun is necessary. Please read about balanced and unbalance feedlines & antennas
http://fermi.la.asu.edu/w9cf/articles/balun/

From: Steve Phillips
Topic: 2743 Message: 2757

I am not an expert. I am asking and trying to understand why so many sources say the balun is not recommended on a G5RV antenna.

For example on http://www.g3ycc.karoo.net/g5rv.htm

In the original article describing the G5RV antenna, published in the "RSGB BULLETIN" for November 1966, it was suggested that, if a coaxial feed was used, a balun might be employed to provide the nessessary balanced-to-unbalanced transformation at the base of the matching section. However, later experiments, and a better understanding of the theory of operation of the balun indicated that such a device was unsuitable due to the high reactance in the load presented at the base of the matching section. In a nutshell, DON'T USE A BALUN ON THE G5RV !!!!!

and....

http://www.qsl.net/aa3px/g5rv.htm
The antenna can be fed by any convenient type of feeder provided always that a suitable type of antenna tuner is used. In the original article describing the G5RV antenna, published in the , then, RSGB bulletin November 1966, it was suggested that if coaxial cable feeder was used, a balun might be employed to provide the necessary unbalanced-to-balanced transformation at the base of the matching section. This was because the antenna and its matching section constitute a balanced system, whereas a coaxial cable is an unbalanced type of feeder. However, later experiments and a better understanding of the theory of operation of the balun indicated that such a device was unsuitable because of the highly reactive load it would "see" at the base of the matching or "make-up" section on most hf bands.

It is now known that if a balun is connected to a reactive load presenting a vswr of more than about 2:1, its internal losses increase, resulting in heating of the windings and saturation of its core (if used). In extreme cases, with relatively high power operation, the heat generated due to the power dissipated in the device can cause it to burn out. However, the main reason for not employing a balun in the case of the G5RV antenna is that, unlike un antenna tuner which employs a tuned circuit, the balun cannot compensate for the reactive load condition presented to it by the antenna on most of the hf bands, whereas a suitable type of antenna tuner can do this most effectively and efficiently.

Recent experiments by the author to determine the importance or otherwise of "unbalance" effects caused by the direct connection of a coaxial feeder to the base of the matching section had a rather surprising result. They proved that, in fact, the hf currents measured at the junction of the inner conductor or the coaxial cable with one side of the (balanced) matching section and at the junction of the outer coaxial conductor (the shield) with

the other side of this section are virtually identical on all bands up to 28mhz, where a slight but inconsequential difference in these currents has been observed. There is, therefore, no need to provide an unbalanced-to-balanced device at this junction when using coaxial feeder.

However, the use of an unbalanced-to-unbalanced type of antenna tuner between the coaxial output of a modern transmitter (or transceiver) and the coaxial feeder is essential because of the reactive condition presented at the station end of this feeder which, on all but the 14mhz band, will have a fairly high to high vswr on it. This vswr, however, will result in insignificant losses on a good-quality coaxial feeder of reasonable length; say, up to about 70ft (21.3m). Because it will, inevitably, have standing waves on it, the actual characteristic impedance of the coaxial cable is unimportant, so that either 50 ohm or 80 ohm type can be used.

Lutz, you will need to troubleshoot the PLL circuit;
this is what the frequency counter is reading from.

It is likely out of lock.

2759. G5RV antenna

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-11-09 16:41:28 UTC
From: Norm Fusaro
Topic: 2743 Message: 2759

Hi Steve.

In reading the article by the inventor of the G5RV antenna, you cut out this section:

By far the most efficient feeder is the "open wire" type. A suitable length of such feeder can be constructed in exactly the same way as that described for the open-wire matching section. If this form of feeder is employed, almost any convenient length may be used from the centre of the antenna right to the antenna tuner (balanced) output terminals. In this case, of course, the matching section becomes an integral part of the feeder. A particularly convenient length of open-wire feeder is 84ft (25.6m), because such a length permits parallel tuning of the antenna tuner circuit on all bands from 3.5 to 28mhz with conveniently located coil taps in the antenna tuner coils for each band, or, where the alternative form of antenna tuner employing a three-gang 500pf/section variable coupling capacitor is used the optimum loading condition can be achieved for each band. However, this is not a rigid feeder length requirement and almost any length that is mechanically convenient may be used.
Since this type of feeder will always carry a standing wave, its characteristic impedance is unimportant, and sharp bends, if necessary, may be used without detriment to its efficiency. It is only when this type of feeder is correctly terminated by a resistive load equal to its characteristic impedance that such bends must be avoided.

Coaxial cable hf choke

Under certain conditions, either due to the inherent "unbalanced-to-balanced" effect caused by the direct connection of a coaxial feeder to the base of the (balanced) matching section, or to pick-up of energy radiated by the antenna, a current may flow on the outside of the coaxial outer conductor. This effect may be considerably reduced, or eliminated, by winding the coaxial cable feeder into a coil of 8 to 10 turns about 6in in diameter immediately below the point of connection of the coaxial cable to the base of the matching section. The turns may be taped together or secured by nylon cord.

In his discussion of not using a balun Mr. Varney does not say if he is talking about a voltage balun in which case this would be true as opposed to a current balun. Since he recommends a RF choke of the coaxial type then this would also be considered a current balun. The same choke can be made by using about 50 #73 ferrite beads on the coax. The point of any of these methods is to not have the outer part of the coax braid act as a radiator.

While the coil of coax is quick and dirty the beads are more effective. A coaxial balun if wrapped around a form such as PVC pipe will be very effective. If usin a balanced tuner, then the balun can be between the radio and tuner. If not, and most tuners on the market are not balanced then the balun goes after the tuner and prefably where the balanced and unbalanced portions meet.

The voltage type balun will definitely heat up as he describes and is not worth a darn in the antenna system.

I hope that this helps you out. The matching device in the PVC tube in commercial G5RV antennas is the ferrite beads around the coax and then sealed in a PVC tube to protect against WX.

Topic: 2743 Message: 2760

I think the point is to not use a typical balun, which consists of turns of wire on a ferrite core (transformer).

As the other gentleman indicated, a coil of coax, ferrite beads, or even a matching section (see Antenna Handbook) will take care of interfacing the coax to the tuned feeders quite nicely.

Good luck.

73,

Eric

Steve Phillips <stevemp@...> wrote:
I am not an expert. I am asking and trying to understand why so many sources say the balun is not recommended on a G5RV antenna.

For example on http://www.g3ycc.karoo.net/g5rv.htm

In the original article describing the G5RV antenna, published in the "RSGB BULLETIN" for November 1966, it was suggested that, if a coaxial feed was used, a balun might be employed to provide the nessessary balanced-to-unbalanced transformation at the base of the matching section. However, later experiments, and a better understanding of the theory of operation of the balun indicated that such a device was unsuitable due to the high reactance in the load presented at the base of the matching section. In a nutshell, DON'T USE A BALUN ON THE G5RV !!!!!

and....

http://www.qsl.net/aa3px/g5rv.htm
The antenna can be fed by any convenient type of feeder provided always that a suitable type of antenna tuner is used. In the original article describing the G5RV antenna, published in the , then, RSGB bulletin November 1966, it was suggested that if coaxial cable feeder was used, a balun might be employed to provide the necessary unbalanced-to-balanced transformation at the base of the matching section. This was because the antenna and its matching section constitute a balanced system, whereas a coaxial cable is an unbalanced type of feeder. However, later experiments and a better understanding of the theory of operation of the balun indicated that such a device was unsuitable because of the highly reactive load it would "see" at the base of the matching or "make-up" section on most hf bands.

It is now known that if a balun is connected to a reactive load presenting a vswr of more than about 2:1, its internal losses increase, resulting in heating of the windings and saturation of its core (if used). In extreme cases, with relatively high power operation, the heat generated due to the

power dissipated in the device can cause it to burn out. However, the main reason for not employing a balun in the case of the G5RV antenna is that, unlike un antenna tuner which employs a tuned circuit, the balun cannot compensate for the reactive load condition presented to it by the antenna on most of the hf bands, whereas a suitable type of antenna tuner can do this most effectively and efficiently.

Recent experiments by the author to determine the importance or otherwise of "unbalance" effects caused by the direct connection of a coaxial feeder to the base of the matching section had a rather surprising result. They proved that, in fact, the hf currents measured at the junction of the inner conductor or the coaxial cable with one side of the (balanced) matching section and at the junction of the outer coaxial conductor (the shield) with the other side of this section are virtually identical on all bands up to 28mhz, where a slight but inconsequential difference in these currents has been observed. There is, therefore, no need to provide an unbalanced-to-balanced device at this junction when using coaxial feeder.

However, the use of an unbalanced-to-unbalanced type of antenna tuner between the coaxial output of a modern transmitter (or transceiver) and the coaxial feeder is essential because of the reactive condition presented at the station end of this feeder which, on all but the 14mhz band, will have a fairly high to high vswr on it. This vswr, however, will result in insignificant losses on a good-quality coaxial feeder of reasonable length; say, up to about 70ft (21.3m). Because it will, inevitably, have standing waves on it, the actual characteristic impedance of the coaxial cable is unimportant, so that either 50 ohm or 80 ohm type can be used.

It sounds like your new rig needs a good cleaning. Potentiometers can be cleaned with De-oxit (R) spray contact cleaner. Spray it inside the pot, then work the control back and forth several times. Obviously, do it when the radio is powered down, and let it sit about a day before you power it back up.

If the wafer switches are particularly bad (i.e. contacts are black instead of silver), I refer you to the following link:
http://www.wb4hfn.com/DrakeArticles/CleaningSwitches/CleaningSwitches.htm
While this cleaning technique is on a Drake website, it should apply to any wafer switch. I did this recently to a Drake T-4XC transmitter, and it worked great! Check it out.

If you have any other questions, feel free to type again.

73,

Eric

Hi Warren, welcome to the group!

Best thing to do is take the covers off the radio and spray some stuff into the controls, hi!!!

Ah, but what's the best STUFF?

I use Caig Labs Cailube MCL. DeOxIt works too, but I don't have a track record on that yet... MCL goes in and continues cleaning for along long time, which means years... without, seemingly, degrading the control any worse than it was.

Get the 2 Oz can; it will last you and several friends a long time.

If you are in Denver, I can lend you mine.

www.caiglabs.com

Hi Eric,

I have not found it necessary to leave the rig off...
I usually clean the controls as part of normal
service, then operate the rig during alignment; this
will show me if any controls need an extra "shot" or
if they are mechanically compromised.

The juice is non-conductive, I believe.

A homebrew buddy has lots of that kind of stuff on hand -- have to in the boonies of north Idaho. Actually, only replaced the one that tested suspect, but going to replace both as "maintenance."

From: Eric Webner
Topic: 2732 Message: 2769

That's just what they say on the cleaning wafer switches technique. Maybe that's from the Tarn-X or denatured alcohol that is used.

Eric

Thanks for the input!

I'll decide which route to take when I get the covers off, but based on the cigarette smell coming out of the cooling fan, I'll plan for the worst.

Subject: Re: [TS-520_820_530_830] scratchy controls

It sounds like your new rig needs a good cleaning. Potentiometers can be cleaned with De-oxit (R) spray contact cleaner. Spray it inside the pot, then work the control back and forth several times. Obviously, do it when the radio is powered down, and let it sit about a day before you power it back up.

If the wafer switches are particularly bad (i.e. contacts are black instead of silver), I refer you to the following link:
http://www.wb4hfn.com/DrakeArticles/CleaningSwitches/CleaningSwitches.htm
While this cleaning technique is on a Drake website, it should apply to any wafer switch. I did this recently to a Drake T-4XC transmitter, and it worked great! Check it out.

If you have any other questions, feel free to type again.

820S is the rig and it takes about 5 seconds which causes me to lose
responses.

How difficult is it to replace these caps...
I have a few rigs that the time has come to do this.
Any precautions, hints/kinks you can provide
appreciated...

Cig smoke is not a death sentence for any rig...

If you can, take the covers off and let the rig sit in the sun outside for a couple of days (bring it in at night, of course!), the sun will help drive out that smell. Meanwhile you can wash the covers inside with Windex, that does a pretty good job of removing the film. I usually boost my Windex bottle with a tablespoon extra of household ammonia; that's what really busts the smoke loose

You can take the fan off and wash it out with the same stuff, then clear water and blow dry it or let it air dry for a day or two; be sure to lube it thru the little holes in the bearing cups on either end; sewing machine oil, 3 in 1 or 10W-30 motor oil injected with one of those little oilers works just fine.

Clean every surface you can get to that is not electronic with a rag dampened in Windex.. power transformer, filter caps, sides of chassis, etc. and the front panel you can remove the knobs and do them with windex and a toothbrush.

Get a set of metric Allen wrenches, and use the 1.5 or 2.0 mm wrench (forget which one) to remove the main VFO knob; then put one drop of oil on the shaft where it goes into the bushing. Look for the gap in the C ring on the shaft and put the oil there. You will notice an immediate reduction in drag. There is a set of washers and a spring to go back on, remember the order in which they come off.

You can also clean the tubes, these will have quite a bit of stuff on them. Don't worry about rubbing the numbers off; everyone knows they are 6146's! hi..

Of course, don't forget to spray the controls, sparingly. Get both decks on the duallies, and rotate the shafts a few times; but you knew that.

Given time, plenty of fresh air and usage, the cig smell will disappear.

Good luck, keep us posted.

73,

Bill K0ZL

```
Good to repl both, it's a voltage doubler and symmetry
is needed in the cap. characteristics.

Usual HV safety warnings, you know, heed them or die,
that kind of stuff.

Make a drawing of where everything goes.

You don't need equalizing resistors with the new ones;
but I do recommend new disk filter caps in parallel,
same value as the old ones, or anything from 470 pf to
0.001, 1Kv will do. Make sure they are the same type
and value as they are in a doubler ckt.

The wires you can unsolder, or just cut them; put in
new jumper wire if it's not long enough. The other
wires are long enough to give you a pigtail so you
don't have to sweat unsoldering them if you don't want
to.

Watch your polarity as you take the old ones out.

I have just picked up a TS-830. The digital display is dim and some of the segments are barely visible.

Just wondering if this is a common problem. Is it most likely the display or the associated circuts. Are the display modules available anywhere.

Thanks for the help

Gene,

Operator and Service Manuals can be downloaded from
http://www.mods.dk/view.php?ListManuals=kenwood. Its a slow site and can
take a while. I haven't read either of these, but neutralization will be
covered.

2782. inrad filters

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-11-19 03:51:45 UTC
From: Sean.....He's the cat that won't cop out
Topic: 2779 Message: 2782

After searching high and low for a yg3395-c CW filter for my 520s, I stumbled upon INRAD : http://www.qth.com/inrad/index.htm

Has anyone had any experience with their filters? $98 bucks seems like a lot but if that is the only game in town, than pay I will. Any opinions on Inrad filters would be appreciated.

2783. Neutralization of 6146's TS-820S

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-11-19 04:47:29 UTC
From: sharpie1241
Topic: 2783 Message: 2783

I just bought the radio and it kept blowing fuses. Replaced fuse, then checked the tubes. One of the 6146 tubes was bad. When buying this radio I also received four 6146W Tubes. And I know I need to neutralize the tubes before trying to trasmit. I Need to know the exact process step by step of how this should be accomplished. The manual and service manual do not make this process very clear.

Thanks

KC4FM

2786. Re: inrad filters

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-11-19 15:28:53 UTC
From: Walter A. Breining
Topic: 2779 Message: 2786

Sean:
I like cats. Beautiful calico is lying on my computer monitor as I speak.

I purchased an INRAD model 88 filter (2800 Hz B/W) for my TS-820 that I bought for $45.00 and restored. Everybody including myself thought I was crazy to spend over $100.00 with shipping on a filter for a $45.00 radio. My original purpose was to gain an extra 400 Hz and extend the bottom end of my audio down to 100 Hz as the roll-off at 400 Hz bugged me. I chose 2800 Hz because I didn't want to be way wide, just add a bit of lows.

When I installed it I swept the rig with an audio generator and adjusted the carrier oscillators so the drop was 6 dB from the center at 100 Hz. I had to readjust the carrier balance also.

I was completely blown away at the unexpected improvement on receive. It was way clearer and seemed more stable but yet I did not have an increase in adjacent frequency problems. As a matter of fact I think it is better.

I worked on another TS 820 with the stock filter for a friend and while I had it I compared it with mine. This was NOT my imagination. What I observed was real.

I don't attribute this to the extra 400 Hz bandwidth. This filter has an extra pole and the skirts are sharper. It also has very good quality control and has very little ripple across the top of its curve. I believe my ultimate transmit bandwidth as well as receive is less than with my old filter because the skirts roll off so rapidly.

Since you are looking for a CW filter, realignment of the oscillators probably will not be necessary. If all of their filters are of this quality, they are well worth the money.

Wish they made one to replace the 2.4 filter in my Ten Tec Paragon transmitter. I now use my 820 more.

Vy 73, Walt N9WB
No I don't work for INRAD

2787. Re: [TS-520_820_530_830] Neutralization of 6146's TS-820S

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-11-19 15:41:18 UTC
From: Bill K0ZL
Topic: 2783 Message: 2787

OK Gene, yep could be bad tube.

You can fire the radio up without tubes to see if it still blows fuses, before putting new ones in.

There may also be some damage to the screen resistors but we will deal with that later.

OK guys let's write a FAQ or procedure for neutralizing... I will present my method, y'all can add to it if you want.

There are several ways to neutralize finals in any hybrid radio (Yaesu or Kenwood). Here is the way that I have found to be easiest and fastest:

Make sure you have a dummy load connected to the rig.

You will also need a screwdriver with an insulated shaft, blade about 1/8" wide, shaft at least 4" long.

WARNING: THIS PROCEDURE REQUIRES CONTACT WITH LIVE ELECTRICAL PARTS USING AN INSULATED TOOL. DO NOT PROCEDE IF YOU ARE UNFAMILIAR WITH THE SAFETY PRECAUTIONS IN WORKING WITH HIGH VOLTAGE. THIS EQUIPMENT CAN CAUSE SERIOUS INJURY OR DEATH.

Unplug the radio and reemove the bottom cover(s) to expose the lower part of the PA enclosure. Locate the neutralizing capacitor. This will be a small air-variable capacitor, usually mounted on the floor of the PA enclosure with the screwdriver shaft pointing downwards. Carefully attempt to turn this screwdriver shaft with your insulated screwdriver. Free up the capacitor as needed BEFORE powering up the rig.

Also check to see that the screwdriver shaft is sufficiently insulated to prevent contact with other components, chassis ground, or yourself. On some rigs you may need to move components slightly to make things more accessible.

Once you have your bearings and the neutralizing capacitor can easily and safely be turned, power up the rig.

Tune the rig for low power on 20 meters, keeping plate current below 150 mA. Quickly tune the PLATE control for dip; adjust the loading control so that the dip is noticeable but not too sharp.

OBSERVE the plate current dip as you rotate the PLATE TUNE control. It should rise smoothly on either side of the dip, and it should rise about the same amount on either side. If so, NO FURTHER ADJUSTMENTS ARE NEEDED; the rig is neutralized.

If not, notice which side of resonance the plate current rises the most. Adjust the neutralizing capacitor to equalize the rise on either side of the plate current dip.

NOTE: This procedure should be done with ONE HAND AT A TIME; in other words, TUNE the plate; let go, then adjust the neutralizing cap with the other; let go, then TUNE the plate again. This will keep the current paths through your body to a minimum in case of a mishap (the old keep-one-hand-in-your-pocket trick will work too).

Once the plate current rise on either side of the dip has been approximately equalized with the neutralization adjustment, tune the rig for max output into the dummy load.

Now rotate the PLATE TUNE control through the dip, and see if the rig RF OUTPUT is maximum when the plate current is at minimum, or very close to it. If so, the neutralization process is complete.

If not, touch up the neutralizing capacitor as needed to make it so.

Plate current at maximum rig output should dip from ten to 15 percent. This indicates peak efficiency for the pi network and longest life for the tubes.

Check also the plate voltage at max output, by using the rig's built in hi-v meter (if supplied) or by SAFELY measuring the plate voltage (do this only OUTSIDE of the PA enclosure; do NOT measure at the top of the plate choke or you will destroy your meter and possibly yourself). Plate voltage should not drop more than 10-15 percent at full output.

Now check neutralization on 15 and 10 meters using the methods outlined above (either RF output maximum coinciding with plate current minimum; or plate current rise on either side of the dip being about

equal). There should be no huge difference. If there
is, AND if one of those is your favorite band, re-do
the procedure on that band. Some rigs do show a
difference from band to band and it's best to
neutralize on your favorite band if that is
preferable).

2790. 820s display

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-11-19 19:27:15 UTC
From: tetrodehead
Topic: 2790 Message: 2790

My new old TS-820s arrived and it's been fine for 3days.
It looks new outside and inside. No dust bunnies or debris inside.
The finals are still S2001A. No mods.

The digital display has suddenly stopped showing the tuned frequency
and instead cycles 9.000.0 thru 9.003.9 then starts over.
Changing bands changes the diplay from 9. to 19. to 29.

I've opened and closed all top connectors but NBG.
The radio tunes normally across the bands.
Any ideas please?

I would check the VCO injection level at TP3 on the RF
unit on 18Mhz compared to the other bands; start
there.

Use a simple RF probe.

If it's the same on all bands, your problem is on the
RF unit.

I used the Tarnex / Alcohol / Deoxit method last night, and it worked
wonders. The receiver really came to life.

Now for an alignment!

Thanks,
Warren - KC0U.

If you are using a typical average reading wattmeter, this is normal. You will only see the full PEP output in SSB if you have a decent peak-reading power meter (or a scope). If you are seeing some ALC action, you are likely reaching full power out.

Hi John,

When you "whistle up" (whistle across the mic, not
into it) and into a dummy load, "watt" do you see for
output?

GE Jim,
You did not specify what position the mode switch was in. Make sure you are in "Tune" mode when checking for idle current. You do have "Heater" on right? Check to make sure the switch marked "SG" right side back panel is on. Try this: Dummy load attached, Drive and Load controls centered,Plate control centered on band the band switch is on, Mic and Car control fully CCW, mode switch in Tune position. Now with meter switch set to read "IP" put send/rx switch in the send position for a moment and see if you have idle current. If not then you have a problem somewhere. Do you have a operators manual? Let us know if this helps!

Okay Jim, we're on it!
Even if the 6146Bs and 12BY7A do light up and get warm, Let's try one more simple thing before the real work begins.
Remove the tubes (being very careful!) and reinstall them a few times each! It's possible you have a bad tube-socket connection(s), so look closely at the tube pins for telltale sign or corrosion, excess dirt, etc. See if the sockets are clean too. If either need cleaning, try the contact cleaning approach as described on the Drake site.

http://www.wb4hfn.com/DrakeArticles/CleaningSwitches/CleaningSwitches.htm

Lemme know if this helps.

Jim:

Here are some stupid pet tricks to try before you open the rig up.

Place meter switch in ALC mode and in the tune position peak the drive control. Do you get any indication?

Go to the Ip meter position. You said that there was no idle current with the rig keyed. Exercise the SG switch on back up and down a few times, be sure to leave it back up and check for Idle current again. It might be dirty.

In still none, locate the bias control on the rear next to the SG switch and mark it's position with a marker or pencil. Move this back and forth while transmitting and see if you start getting idle current. If not return it to the original position. It might have been dirty.

If still no go, check to see if the 6146 filaments are lit. You probably will be able to peak through the vents without removing the final cover. You may even be able to observe this through the fan opening without taking anything apart. Try turning the room lights off.

Let us know what you find.

A word of CAUTION, If you do go into the final section, there is High Voltage even when receiving. After unplugging radio there may still be voltage on the tube plates. With the transceiver unplugged, wait a few minutes, and short the top contact of the plate choke to ground with a metal screwdriver, while touching only the plastic screwdriver handle.

Either bad 6146 tubes; or bad screen resistors, failed
because of bad tubes; or bad dropping resistor on the
power supply RECT unit for the 220v to the screens; or
broken wire at the very top of the plate choke.

All due respect; I have never seen these sockets fail;
esp not two at a time.

Also I don't recommend spraying or otherwise applying
any sort of cleaner to transmitting tube sockets; it
will increase the chance of attracting airborne dust
and subsequent breakdown of the socket insulating
material.

I would favor investigation with a voltmeter, checking
screen voltages first; and then visual inpection of
the plate choke; these are pretty fine wiring on these
things and simply changing tubes can sometimes break
the wire at the top of the choke form, if it's
stressed just right. I have found two of these failed
so far.

Hey I thought the PA filaments were on.. but they
arent. That's why no plate current, my goodness.

I think the 820 had a acc plug in the back that made
the filament circuit when you weren't using the
transverter, no? someone correct me on that.

Anyway you will be t'shooting your filament
circuits...

Jim,

Heaters are in series so a failure of one heater puts both out.

Heater pins are 2 and 7 for 6146. See page 32 of Operator's Manual (or
download from www.mods.dk) fro schematic of PA.

From: jimbart
Topic: 2810 Message: 2810

Anything in particular to look for (or look out for!) when using these together? There's no reference to either in the literature of the other & I'm wondering if the AT250's ACCessory cable is a direct connect to the TS830's REMOTE jack, or if it's limited to a coax connection.

2811. Re: [TS-520_820_530_830] Re: Kenwood TS820s Help?

Bill,

From schematic in TS820 Operator's Manual, the heater winding from the transformer goes to pin 10 of the power connector. It is jumpered via the mating connector (the one with the AC power cord) back onto pin 7 and then it goes to the heater switch and on to the driver and PA heaters. It is connected to pin 4 of the VFO connector but not to the remote or Xverter connectors.

I suggest Jim checks that pin 7 is connected to pin 10 in the power connector on the end of the mains cord.

Apologies!!! Seems I've failed to introduce myself:
My name is Jim, KE5CXX. I live in Oklahoma City and am building my shack around a TS830S, Icom IC730 and Yaesu FT2600M. I'm retread from many moons ago as WA2SWA.

Hi Jim, welcome back!
The TS-830 and IC-730 are two of my all-time favorite radios!

The 12BY7 lights so the jumpers are there. By first guess is that one of the 6146's (S2001s) has an open filiment. Next I would check for bad solder at the filiment pins on the bottom of the board. Then I would check for a bad solder connection on the pins that the wires go to on the board.

I would suspect an open filament. I actually had a situation where
there was some sort of low resistance

filament short in the tube to some other part of the tube which resulted
in 12 volts across one tube. The

6146 lit up like a 100 watt bulb.

Does anyone know the upper limit of TS-830s serial numbers and when they were produced according to that number.

I have one that is in the 4 million range and I really did not think they got that high.

Tnx es 73

Thanks All & The Group!
For all your help and assistance. I think I got it. Changed a 6146 still no luck. So I went back and re-sweated all the joints that dealt with the filament circuit and BAM! There she was! The 6146 lit up!! But the other one didn't :-(
Now have plate current and will show abt 10 watts into dummy load, but I'm afraid to xmit much more than that. Anyone know of good place to get the 6146B for this ts-820? Any help will be greatly appreciated. Really enjoyed the experience. Maybe it's all coming back to me now thanks to you guys!
Happy Thanksgiving and best of 73's from Jim KD4LOW

That's way newer than mine: 2080050, originally purchased 24 June
1982.

So I bought an Inrad CW filter and was installing it tonight. Soldered leads to the filter, put the hot leads from the filter into the holes in the board, then I figured I would power up the radio and touch the ground leads to the ground post and listen for the difference. Well everything seemed to work for a minute but then I flinched and I think I bumped the ground leads against a pole labed "gen" ....a little spark and then silence...arghh!!!!!!!!!! The rig still lights up and when I flip the heater switch the mains light but it definitely seems like I fried something in the receiver section. Anyone have any guesses. Just my luck to kill my rig on the eve of the CW contest I bought the CW filter in preparation for. sigh

First, as a precaution, tape up the ends of the plug that was plugged into the speaker on the top lid. This will keep this plug out of mischief. If it touches high voltage, you will hate it.

Unplug the radio; discharge the plate leads and put both finals back in. Turn the radio on and note, which tube glows. I'll bet it is
V1, the one nearest the front of the radio.

Unplug the radio, discharge the plate leads and swap tubes like Don suggested. Turn the radio on again and note which tube glows. I'll
bet it is still V1, the one nearest the front of the radio even with the tubes switched.

If not replace the tube that does not glow.

If it is Tube position V1 that glows both times proceed as follows.

Unplug the radio, discharge the plate leads and remove both finals.

Unplug the radio, discharge the plate leads and remove both final tubes. With the radio still off, check the foil on pin 7 V1 and Pin 2 of V2 for solder bridges. On the bottom of the final board there is a pin labeled H. 12V go into this pin. Foil runs from there to pin 2 of V1. Counting clockwise (board bottom) count to pin 7 of this same tube. With the tubes still removed, use an Ohmmeter, check the ohms from pin 7 V1 to ground. This should show an open circuit. (Infinite OHMS) If it shows a short, (low Ohms) again look carefully for solder bridges. If none are found, note that there is a .04 uf capacitor From Pin 7 V1 to ground. This is probably located on top of the board. Unsolder one end of it and again check the OHMS between pin V1 pin 7 and ground. If you now show infinite or very high ohms, C4 is shorted and should be replaced

How this circuit works:
On the bottom of the final board there is a pin labeled H. 12V go into this pin. Foil runs from there to pin 2 of V1. Counting clockwise count to pin 7 of this same tube. From this pin, a wire on the top of the board runs from this point (V1 Pin 7) to V2 pin 2. Also a .04 uf capacitor is connected from V1 pin 7 to ground. Pin 7 of V2 is connected to ground foil.

The filaments are in a series circuit. 12.6 VAC is applied to pin 2 V1 from pin H. This goes through the V1 filament and drops to ½ voltage (6.3 volt) to Pin 2 V2 by way of the wire on top of the board. This remaining 6.3 volts lights the filament of V2, by

flowing through it to V2 pin 7 that is grounded.

Let us know what you find. If it is not a solder bridge or C4 we will come up with something else.

By the way in the unlikely event that there would happen to be a resistor with a value of something like 6.2 Ohms connected to pin 7 V1 on the bottom of this board, stop and tell us. It has been modified for one tube operation. This is very unlikely however.

If a rig will not receive ANYTHING... you hear hiss
only, even with outside antenna connected or sig
generator cranked to max; the problem with ALWAYS be
either a power supply voltage missing to the receive
or IF circuits, or a dead VFO or local oscillator.

Even a PLL rig will receive something, even if it's
trash, if the VCO is out of lock.

So check your switched control voltages (8v or 12v
receive, coming off the T/R relay) and use the RF
probe to check your injection voltages to the RF unit
first, then the BFO oscillator on the IF unit.

From: Sean.....He's the cat that won't cop out
Topic: 2816 Message: 2827

So I went back to the rig, a little less emotional this time. Here is additional information and observation

TS-520s

Rig lights up/powers on
Finals light when heater switch flipped
No sound of any kind from speaker with AF cranked (yes, speaker is connected)
VFO LED no longer lights
No meter deflection in tune, cw or ssb mode
I do not hear the T/R relay flip when I key down

Won't TX and won't RX. So...it seems pretty killed. I am no genius with repair and since I only got back in radio in September, have no test gear. Whatdya think?...besides next time I will be a lot more careful.

Thanks Bill for you insights, and to anyone else who takes the time to read this.

I am thinking that the low voltage (14v) supply is
dead, eh?

Get a cheap DVM from RatShack and dig in.

Sean,

Your rig sounds very dead so maybe you've taken out the low voltage regulator. That might account for the flash that you saw. I've downloaded the TS520 Service Manual from the web, although the schematic is poorly reproduced due to the digitization process. Try www.mods.dk if you haven't got a copy.

There is a dc regulator on the FIX CH AVR UNIT (AVR = Automatic Voltage Regulator) and section 3.11 of the Manual gives details about setting this. The regulated supply is 9V. This circuit board is mounted on the top of the chassis behind the VFO.

The regulator is a fairly standard discrete component circuit (Q1 to Q4) and it doesn't have a current limit, so it will not take kindly to output shorts. There is a second 3.3V supply as well, probably run from the 9V supply.

Although difficult to see on the downloaded copy, I think the series pass transistor is Q4, which is a 2SA606. This is a PNP metal-can transistor, maybe a TO-5, and I think it is the only metal-can device on this board. If it has been zapped, then I am sure we can find a suitable 2Nxxxx replacement. I see that the 2SA606 is available in Europe so maybe a search will find some in US. A fall back would be to make up a 9V regulator using an LM317 or similar - at least that would have a current limit.

Fig 25 in the manual gives the board layout and helpfully labels the 9V output and GND pads.

Get your multi-meter out and good luck! Watch out for the high-voltages.

I'm QRT on e-mail until Monday but look out for the G3 sending poor CW in the CQWW contest....

Bill,

Further to my earlier posting - another reference on the web mentions a 2A DC fuse in the TS520. I can't find it on the poor copy of the schematic that I downloaded. Does it exist and do you know where it is in the unit? Another likely candidate?

Again, I can't tell from the circuit but I assumed that the circuitry would be powered from a regulated supply. Is that so, or are most of circuits powered from 14V unregulated?

2833. Re: [TS-520_820_530_830] fearing the worst - MORE INFO

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-11-25 20:57:47 UTC
From: Sean.....He's the cat that won't cop out
Topic: 2816 Message: 2833

My rig has 6A and 2A fuses located externally. The first thing I checked was the 2 amp fuse. I was really hoping that was all that went bad but no such luck. Good thought though.

Thanks to you and Bill for the thoughts and responses. I will be digging in a little deeper this weekend.

Hi Jim,

Enjoy your radio !

http://www.surplussales.com

http://www.surplussales.com/Tubes-Sock-Acc/TubeSpecials.html

He has 6146w by GE USA made each or pairs also the 6146B
and also has the driver tube too.

He is good to deal with.

73 james

From: kd4low@...
Subject: Re: Re: Kenwood TS820s Help?

Thanks All & The Group!
For all your help and assistance. I think I got it. Changed a 6146 still no luck. So I went back and re-sweated all the joints that dealt with the filament circuit and BAM! There she was! The 6146 lit up!! But the other one didn't
:-(
Now have plate current and will show abt 10 watts into dummy load, but I'm afraid to xmit much more than that. Anyone know of good place to get the 6146B for this ts-820? Any help will be greatly appreciated. Really enjoyed the experience. Maybe it's all coming back to me now thanks to you guys!
Happy Thanksgiving and best of 73's from Jim KD4LOW

The 14V line fuse is 2 amp, and is located underneath
the rig somewhere near the large choke, near C15 and
C16. That choke is after the fuse, so if you don't
have 14vdc on the choke (measured to ground), the fuse
is definitely blown.

I suspect that you touched the "14" terminal; GEN has
no DC on it, it's all capactively coupled small AC
sigs.

I have a note regarding symptoms of the fuse being
blown; however no notes as to the location. This means
it must not have been too hard for me to find, last
time I had to! Keep looking.

bill

so this is a different fuse then, from the fuse on the back of the rig? I shall look this morning. The last rig I worked on was a Heathkit DX-100. Lots more room to move around in. Even though the 520 is 30 years old, it still seems like Enterprise in there. Either way, that is encouraging. Man it would be great to replace a fuse and get back on the air.

Thanks again guys

Sean

I have the service manual on the ts520 and it has a trouble shooting chart in it step my step checks that can be made
do you have a cable conection so I can send it to you ??
its 7 megs PDF file...or I can snell mail you it on a disk //

Unplug and take bottom cover off; look carefully
around the area where the power transformer is.

Sean

It might be "useful for all" if you can "drop such document" in the
Yahoo files section.

Sean

I have the service manual on the ts520 and it has a trouble shooting
chart in it step my step checks that can be made
do you have a cable conection so I can send it to you ??
its 7 megs PDF file...or I can snell mail you it on a disk //

2843. RE: [TS-520_820_530_830] Re: fearing the worst - MORE INFO

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-11-26 19:46:01 UTC
From: Sean.....He's the cat that won't cop out
Topic: 2816 Message: 2843

Many, many thanks to all that weighed in on my rig. It is up and running. CW filter is installed and 4 DX QSOs made today.

With the most sheepish of grins; the answer after all was said and done was the external 2A fuse. I swear I pulled it out and looked at it closely under a bright lamp (twice) and it looked fine but figured since we were suspecting fuses, perhaps I should outright change the fuse. What the heck. Well that did the trick, good as before. Hopefully you guys won't throw me off the list for not out and out replacing the fuse before asking for help. A lot was learned from you guys anyway. Today was the first time the bottom cover was off the radio so that was intructional. Thanks again

WA8THK, if you send the service manual to me at sean001@..., I will break the pdf into two pieces. It will only take a minute. I will then post it to the files sections here.

Always, always, always check fuses with an ohmmeter.
Especially if your eyes are as bad as mine!
Good learning experience.

Now you have a lesson to pass on to others. (1) use your meter to check
fuses and (2) don't be working on components when the rig is on.

2846. Tuning TS830S transmit problem

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-11-26 21:00:55 UTC
From: jimbart
Topic: 2846 Message: 2846

Bandswitch at 7MHz (40m)

Per instructions:
50 Ohm dummy load (named after me) connected
Power & Heater ON
Mode = SSB, Meter = Ip
Standby = SEND, bias = 60mA
(so far so good, eh?)

Mode = TUNE, meter = ALC
Peak DRIVE ... oops: no movement on the meter!
try to adjust CAR upward to get meter deflection: Oops! No
deflection.

Let's try:
Mode = Tune, Standby to SEND,Meter to RF and Peak the Load
Oops: no movement ...

Mode = CW, meter to Ip ... well, by now, you can guess: no response
(but a nice keying tone from the Bug)

The fan is spinning nicely, and the cabinet is ever so slightly
warmer around the Final section, but that's it ...

Mode = CW, Standby switch to SEND, meter at HV reads 900V.

Repeat with bandswitch at 14MHz (20m), all as above

Long story short: DRIVE won't peak, PLATE won't dip and LOAD won't
peak. But I can get Ip to 60mA ...

Receive has worked well all along.

Any ideas?

Jim
KE5CXX

Jim:

Just because it is easy, I would try the 12BY7.
Finals are working or you would not get the 60 MA.
Is the 12BY7 Lit?
Do you have a tube checker to check it? (Yeah I know, but if it was
this dead it would show up on a tube checker).

Do you have another 12BY7 to plug in?
Check the solder connections from the 12BY7 socket to the board.
Clean the 12BY7 socket.

If you change 12BY7s there is an issue that all 12BY7's will not
work
just right, but any good one should get you some action on 40 meters
so you will know if you are on the right track.

If the above doesn't tell you anything, someone who is more
familiar
specifically with the 830 will hopefully chime in.

Vy 73, Walt N9WB

Walt,
Don't have a tester, but did try 2 other 12BY7s (not sure new or
old; came in a bag with the rig); symptoms remained.
It's a puzzlement ...
Thanks & 73,
Jim

From: Tibor (Tibi) Zentai
Topic: 2816 Message: 2852

Hi All,

Thanks to Bill for the approval to let me be a member of this list. The pleasure is mine to join the group.

Though I know it is not the topic of the list I have also a vintage 2 meter FM radio manufactured by Clegg Communications Company, a Clegg FM-28 which is about ten years older than my TS-530SP. Both radios are in regular daily use.

When I was much younger I was a homebrewer designing and constructing my own cw/ssb rig. Later on I used military surplus QRP cw as well as 29 MHz FM transceivers. Believe it or not I could take out the best of those rigs, much, much more than designers specified and the original users had ever been able to. This objective has not changed in using the TS-530 SP that I have since last March.

Nowadays, I hate to remove the case of my equipment. I am no longer wondering how it looks like inside, how it works, etc. But alas, devil of electronics cannot be sent back to its shelter so if something is going wrong who is gonna take care of your rig if not you?

By the way, I am able to operate digi modes with the TS-530SP as well. Though my friends said me to give digi operation up for I can operate traditional modes that are considered to be a true way of showing the human capability against showing the capability of a computer (I won't fully do it really). This situation leads to the debate of code vs no code. Well, I understand the problems of the hobby but I am convinced that the code (beside many advantages) is an international language to bridge a kind of gap among different not English speaking cultures.

Why am I making QSOs instead of using internet facilities? 'Cause ham radio operation is still a challenge against nature. 'Cause it means to owe to a specially trained, closed and a specially friendly society with common interest called ham radio service officially.

My friend Gabriel, WH6CVI mentioned a few weeks ago that there is a special list dealing with old Kenwood radios and he suggested that I should have join it. Thank you, I can now be here. Should I be the first Hungarian list member it is a special pleasure of mine.

I think that's all for a short introduction now.

As a quick help for the TS-520 issue, service manuals can be downloaded:

http://www.dsgnet.hu/nightwish/work/TS-520-520SE_Service_manuals.zip

Hope to change a signal riport with most of you during the CQ WW DX CW contest.

Well.. uh... if I did that, I would have to kick
everyone else off. Starting with me. But then I
couldn't throw anyone else off, because I would be
gone. Oh nevermind.

Glad you got 'er fixed!

Let's remember to suggest this, right after asking
about the screen grid (SG) switch! hi..

WV5 would be a tough contest callsign.. DX ers would
think you are W45 or something.

Tim,

I think this code from your local Radio Shack will work:

Catalog #: 272-1092

Lots of fun changing those lamps, while you are at it you might as well change all three (two on the S-meter and one behind the VFO). You will also want some of the very small heat shrink tubing to insulate the soldered wires (yes, you have to lap solder the wires together). Heat shrink is much nicer than tape which will eventually get gooey and messy inside the rig.

Jim

That's the correct RS stock number. There are two in a package.

I changed mine not too long ago.

Sean,

Congrats on getting back on the air. After 10 years in the alarm business, I gotta agree with Norm: check those fuses with a meter, because every once in awhile they blow just a bit, and you can't see the break too well.

73,

Eric KA8FAN

Norm Fusaro <w3iz@...> wrote:
Now you have a lesson to pass on to others. (1) use your meter to check
fuses and (2) don't be working on components when the rig is on.

Welcome to the group, Tibi. It is nice to have you with us. I liked your paragraph about the ham radio society vs. just using internet. I should show that to my wife. She doesn't understand what ham radio is all about.

73,

Eric KA8FAN

"Tibor (Tibi) Zentai" <ha2mn@...> wrote:

Hi All,

Thanks to Bill for the approval to let me be a member of this list. The pleasure is mine to join the group.

Though I know it is not the topic of the list I have also a vintage 2 meter FM radio manufactured by Clegg Communications Company, a Clegg FM-28 which is about ten years older than my TS-530SP. Both radios are in regular daily use.

When I was much younger I was a homebrewer designing and constructing my own cw/ssb rig. Later on I used military surplus QRP cw as well as 29 MHz FM transceivers. Believe it or not I could take out the best of those rigs, much, much more than designers specified and the original users had ever been able to. This objective has not changed in using the TS-530 SP that I have since last March.

Nowadays, I hate to remove the case of my equipment. I am no longer wondering how it looks like inside, how it works, etc. But alas, devil of electronics cannot be sent back to its shelter so if something is going wrong who is gonna take care of your rig if not you?

By the way, I am able to operate digi modes with the TS-530SP as well. Though my friends said me to give digi operation up for I can operate traditional modes that are considered to be a true way of showing the human capability against showing the capability of a computer (I won't fully do it really). This situation leads to the debate of code vs no code. Well, I understand the problems of the hobby but I am convinced that the code (beside many advantages) is an international language to bridge a kind of gap among different not English speaking cultures.

Why am I making QSOs instead of using internet facilities? 'Cause ham radio operation is still a challenge against nature. 'Cause it means to owe to a specially trained, closed and a specially friendly society with common interest called ham radio service officially.

My friend Gabriel, WH6CVI mentioned a few weeks ago that there is a special list dealing with old Kenwood radios and he suggested that I should have join it. Thank you, I can now be here. Should I be the first Hungarian list member it is a special pleasure of mine.

I think that's all for a short introduction now.

As a quick help for the TS-520 issue, service manuals can be downloaded:

http://www.dsgnet.hu/nightwish/work/TS-520-520SE_Service_manuals.zip

Hope to change a signal riport with most of you during the CQ WW DX CW contest.

2865. Modulation level

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-11-30 02:25:06 UTC
From: dmfroelich
Topic: 2865 Message: 2865

In peaking the ALC level during initial set-up, is the drive adjusted for full-scale meter reading or to the upper edge of the ALC range on the meter? Thanks. Don

2866. One more question ts820?

Yahoo group: TS-520_820_530_830 (2001 — 2004)

One of guys said something in a reply, abt a one tube Mod.. sorry i dont rember the call.since I have this thing working with only 1 pa tube can I do the mod? it its not to hard HI HI. so I can do some audio test and wire up a mike and work 10 meters on temp basis... I plan to upgrade to general 16 dec...that way I can find another tube by then...also should I get matched pair like I have heard for years.. and what should I replace these with? eg. (GE, sovtech Svelanta?)..Also where can I get the mod..If U guys think i should do it?..or should I just wait?....TNX for all the help.. This group is great!!... 73s to all!... TNX Jim KD4LOW...

Don:
Maybe I haven't been paying attention, but I am not sure what rig
you
have.

With my TS-820, I can usually get full scale on the ALC meter in the tune position if I advance the drive all the way so I reduce the drive so I am below the end of the meter and can see the peak.

After I am done on Tune, I go to CW and advance the drive fully or to the point where I am just below the meter top so I can see the peak without it hitting the needle top. Sometimes, especially on the higher frequency bands, the meter will not go up this far even with the drive fully advanced. That is OK.

Remember when doing final tuning in the CW mode, not to transmit for long periods as the finals will get hot fast.

After tune up, on SSB while talking I set the mike gain so the meter sometimes goes to the top of the ALC scale that ends at about 60% of the full meter deflection and on occasion slightly over this point.

I you use a compressor or the speech processor, you may want to set the deflection to ½ the ALC scale.

When operating CW I set the drive control to go to the top of the ALC scale on key down.

During the beginning portion of my tune-up with my 830S, I put the rig in TUNE, set the meter to ALC, then key up and adjust the DRIVE until the ALC reading is peaked. If there is no ALC deflection, I increase the CARrier level and then peak it. If the peaked ALC moves beyond the max ALC range, then I reduce the CAR level. I usually use a peaked ALC reading of 50-80% of the ALC scale. Once the DRIVE is peaked, I then switch to IP, and dip the plate current with the PLATE control. Then, switch to RF and peak the output with the LOAD control. I'll usually alternate a little between PLATE and LOAD to peak the output. Works dandy.

Jim:

What did you find out was wrong.

There was a mod for the TS 820 for novice operation in the early days and I think to accommodate a Japanese power restriction with some classes in Japan. This would make the radio operate with 75 watts with one tube. I wanted to be sure your radio didn't have this. If it did, I was going to help you restore it to two-tube operation. You want to use both tubes.

While we are on the subject of mods, there is a mod for this rig that involves increasing the screen voltage and some other things to increase the power. I Do NOT personally recommend this change. The beauty of rigs using 6146 (S2001) tubes over rigs that use 6JS6 tubes is they are far more forgiving during tune up. The increase in power from this mod is not noticeable on the air and puts stress on the tubes, transformer, and rectifier diodes.

I hope others will comment on tubes. Since the tubes are in parallel not push pull, a exact match is not necessary. They just need to be good.

Please note that while the tubes are operated in parallel, this is different from the filaments that are in series.

Are your original tubes bad? If you replace the tubes, you will have to re-neutralize.

Again, what did you find wrong?

Keep your carrier or drive LEVEL down so that the ALC
meter is not pegged; then tune your DRIVE stage for
max ALC reading.

From Alan's text below: "If the peaked ALC moves beyond the max ALC range"

Additionally, the meter face has a "red line" indicator where "max" ALC should be set in the TUNE position.

Pete, wa2cwa

On Mon, 29 Nov 2004 22:24:51 -0500 Alan Wolke <w2aew@...> writes:

Remember that ALC control voltage is derived from the final tubes' drawing grid current. By definition, the very instant a class AB amp draws grid current (grids going positive with respect to the cathode), you are overdriving the tubes.

A small amount of overdrive is not harmful; since a Class AB amp is already in distortion for half the RF cycle, a little non-linearity does not noticeably increase the odd-order distortion products (i.e., splatter). But a lot, will.

Purists would argue that ANY alc indication is not tolerable... in fact, if we run a legal limit amp, that may be true! at least for our "frequency neighbors"... but a little is OK.

I would stay away from the redline on the ALC indication on any rig; just to bump the ALC is OK but we should not be hammering it all the time.

Bill's rule of thumb: On tune-up, turn carrier down to keep ALC off the right-hand peg, so you can see the peak as you tune the DRIVE control. On voice operation, turn mic gain down until you are just bumping the ALC a bit on voice peaks. Avoid temptation to beat the heck out of it; this just increases distortion.

Peter, good observation.

Jim:
I am concerned that either you do not have bad tubes, or you have more problems than just that. If you have other problems and you put new tubes in, it could damage them. I suspect that the filament of one tube is running on 12 v and the other has no voltage.

If I follow you right, your present condition is that the tube at the front of the PA cage lights but the one at the back does not. I also understand that you have a total of 3 tubes available. Two tubes from the rig and another one that you scrounged.

If so please do the following exactly.

First, please note that every time you turn the rig on, there will be high voltage. This means that every time that you unplug the rig that high voltage will remain there for a while. You can be seriously injured, so every time that you go into the PA cage it is very important that you do the following:

Unplug the radio line cord from the outlet. Wait at least two minutes since it was unplugged. Using a screwdriver with a plastic handle, short the terminal on top of the plate choke to the chassis with the screwdriver for about 10 seconds. This terminal is the one that the leads with the parasitic choke and the plate connectors connect to. If you have a wire with two alligator clips connect it from this point to chassis ground and leave it there while you are working in the cage. Don't forget to remove it before you turn the radio back on.

Now with that in mind, do the following:

DO NOT change or remove the tube at the front of the PA cage that is lit.
Remove the tube that is at the back of the PA cage.

With the rear socket empty, plug the rig back in and tell me if the remaining (front) tube is still lit. (Don't forget to remove the clip lead from the plate choke before plugging the radio in.) Be sure the heater switch is on.

Now, IF THE FRONT TUBE IS STILL LIT unplug the radio and tell me. Wait until you hear from me and I will take you to the next step.

ONLY IF YOU ARE SURE THIS TUBE (front) is NOT NOW lit, put one of your two remaining tubes back in the rear socket. LEAVE THE FRONT TUBE AS IS. (Be sure to observe the discharging procedure outlined above). Remove the clip lead, plug the radio back in, and be sure the

filament switch is on. Tell me, Does the front tube light? Does the rear tube light?

IF BOTH TUBES NOW LIGHT unplug the radio, tell me, and wait until I get back with you. Please note that when both tubes are lit, neither will be as brightly lit, as the front one will be by itself. You may want to switch off the room light and take a second look.

IF ONLY THE FRONT TUBE LIGHTS, unplug the radio, discharge as above, and replace the REAR tube with your third tube. DO NOT REMOVE OR CHANGE THE FRONT TUBE.

Remove the clip lead, plug the radio back in, be sure the filament switch is on and tell me what tubes are lit. Unplug the radio and wait to hear from me.

Also please tell me, do you have a multimeter, such as a cheap radio shack Volt-ohm meter?

2878. How about a "Gee, what a great rig!" post?

Date: 2004-12-01 20:03:27 UTC
From: jimbart
Topic: 2878 Message: 2878

As I noted in an email to Bill-in-Zero-land, I finally got my TS830S on the air on Monday. The rig drives a dual-band dipole (Alpha-Delta DX4020) hung flat-top in the attic, at about 18' above ground. Feeder is 50 feet of RF9914F Bury-Flex coax (for durability and low-loss characteristics). The antenna is strung N-S, so major lobes are E-W. Got no idea what the other stuff in the attic does to propagation - or what the propagation does to it! MFJ901B tuner brought SWR down to about 1.2:1.

Running at about 70%-80% power, I worked my first CW QSO's in over 40 years - the first of any kind, for that matter - on 40m. On Monday, the rig got 579's from central Ohio and So. California.

Last night, signals weren't quite so good but still within reason: 569's or so from Milwaukee, WI area and central Massachusetts, and 369 from Santa Clara, Cuba. QRN seemed nastier than usual. I tried to get back to an XE in Mexico City, but no joy.

Given the constraints I placed on them (less than full power, less than ideal antenna placement and less than ideal conditions - not to say less than top-notch operator!) I'm really pleased with, and impressed by both the TS830S and the antenna.

There's a guy who posts elsewhere (eHam.net, I think) who closes his remarks by writing "Real radios glow in the dark!" Even with the IC730 as backup, I think I agree with him.

Geez, these are great rigs!

73,
Jim KE5CXX
PS: The DX4020 looks like the current DX-EE without the 15m and 10m wire. Since it doesn't appear on Alpha-Delta's website, I suspect it's been discontinued, and am quite happy to have found one.

Hi Jim,

The important thing is, you are on-the-air! That's great.

Sounds like your antenna is parallel dipoles. One nice thing about "real radios glow in the dark," is that if you were only going to work the bands that the antenna is cut for (80 and 40 meters, for instance), then you can forget the antenna tuner. The pi-net on the 830s will still load up the antenna quite well.

I wish I had heard about "real radios glow in the dark" sooner, because I heard some guys refer to tube rigs as "geezer radios." I am only 41, and I've always used tube rigs!

73,

Eric KA8FAN

From: jimbart
Topic: 2878 Message: 2881

Thanks for the thought, Eric; I've gotten lots of encouragement and appreciate it all.

The antenna is a single wire dipole with what A-D calls an "Iso-Res" coil to load it for the lower band. If it had a capacitor, it'd be a trapped dipole, but as it is, I think the thing just acts like a loading coil. If you look at the DX-EE on the Alpha-Delta website, (http://www.alphadeltacom.com/pg1.htm), you'll see that it has three parallel dipoles, the upper for 40 & 20, the middle for 15 and the lower for 10. The DX4020 looks like just the top of that.

Comparing my Kenwood to my Novice rig is a trip. That was an open chassis homebrew 15W, crystal-controlled xmtr for 15m. Receiver was a Heathkit AR1 (a 5 band AM superhet) and antenna was a long-wire from my 2d floor bedroom window to the tree in the back yard. VHF (2m) was via a borrowed Gonsett II Communicator, about 5w out, I think, into a top-mounted 19" whip. It was all I could afford, but it was fun, and I suppose that's what counted then (and now!), especially for 1-yr Novices.

Compare the TS830 to today's stuff, and it just boggles the mind. I had no compunctions about tearing into the guts of my '49 Ford, but now I leave my Maxima to the professionals. Same-same the radios.

I hope we get to work each other one evening, but in the meantime, enjoy the glowing tubes. I don't know about you, but I like campfires better than Coleman stoves ...

73,
Jim
KE5CXX

OK Jim:

Now we can arrive at some conclusions. First we know that you had the heater switch on, as you should have because the driver was lit. Since the rear tube quit glowing when you removed the front tube, C4 is not shorted and there is not a solder bridge to ground, as I thought possible.

If you have a white spot in the tube, it looks like the vacuum in the tube is gone. Tubes often have a black spot but not powdery white. Leave the tube that you have in the rear and do the following to this tube and the other one that you have on the table:

Place your meter on ohms x1 and short the leads together. Adjust the ohms adjustment for 0 OHMS.

You now need to locate pins 2 and 7 of the tubes. With the bottom of one of the tubes facing you there will be a shaft in the center of the circle of pins. This shaft will have a cog on it. Clockwise from the cog will be pin 1. The next pin clockwise will be pin 2. Mark pin 2 with a felt tip marker or crayon. Counterclockwise from the cog will be pin 8. The next pin counterclockwise will be pin 7. Mark pin 7 with a marker. Now, connect one lead of your meter to pin 2 and the other to pin 7.

Here is a link to the pin out of the 6146.

http://tdsl.duncanamps.com/show.php?des=6146

Read the Ohms.

If the filament is good meter should be 0 or very close to zero. Just as if you had the meter leads shorted.

If the meter shows infinite ohms between pins 2 and 7, just as it would if you did NOT have the meter leads connected, it has an open filament.

Now do the same thing with the other tube that is out of the radio.

Let me know what you find.

BTW, It now looks like you need to think about ordering two new tubes. Go ahead and order them but we should check some things before you put them in.

Vy 73, Walt N9WB

Ah - I don't see the article that way Walt. It says the 6146B is not a direct substitute for the 6146 and 6146A which were used in Collins gear. The Kenwoods were originally fitted with the S2001A which is the direct equivalent of the 6146B, so that's the one to use. What the 6146W is equivalent to depends on when it was made, but the later ones most likely to be found are comparable to the 6146B so it's ok to use them too.

I have a spare set of tubes maked 6146B/8298A. They
must be the extra heavy duty variety that were
mentioned in the article as a substitute for the
6146B.

Dave is right in that the article says that the "B" is
not a direct substitute and that most gear will react
a bit finicky with them if not the original design.

I personally don't have any of that older gear that
used the 6146 so I can't give a first hand opinion.

6146B, GE is most common; order new set from RF Parts,
Westgate Parts or off ebay from a reputable seller,
Buy only 'NOS' ("new old stock") or unused tubes.

I have read that but my experiences do not support the
conclusions.

I use the B series because of the higher plate
dissipation ratings. Have never had a problem
neutralizing the GE series.

I have also used the W's successfully; although they
have lower plate dissipation, they seem to last just
fine. And this in radios that I have done the high
power tx mod!

Like Bill, my own experiences over the years with the 6146 family don't support all the conclusions drawn from Glen's site. I've used B's in early Heathkit and Johnson rigs all the time . Currently, my Apache has a pair of B's in it and so does my Valiant(actually 3 of them). My Johnson Ranger has one. My 830S and T-599D also have a pair of B's in them. During a contest years ago, one of my S2001A's failed in my Kenwood T-599D transmitter. Didn't have any B's handy, so pulled out the other S2001A and replaced the both of them with a pair of 6146A's. No problems here either other than not running them as hard. Of course, Glen has his own experiences and drawn conclusions.

Pete, wa2cwa

OK everybody:

It looks like Jim is going to have to order some new tubes for his TS
820. What should he get (make and brand) and where should he order
them from? Are S 2001s still available or does it make any
difference?

Harmonics don't melt down tubes, excessive plate dissipation for too-long of a time does it.

There are several ways of getting excess plate dissipation:

Running the transmitter with the PLATE circuit out of resonance (out of the dip) for a long period of time, say in excess of ten seconds.

Running excess carrier in the digital modes, or in AM or FM (not applicable to those rigs that don't have those modes of course).

If your SSB idle current is 60mA, let's say that is split up between the two tubes, evenly. That is 30mA or 0.03 amperes per tube. If your plate voltage is 800 volts which is typical, you are running 0.03*800 watts or about 24 watts per tube of plate dissipation or heat. Since it's all DC current, and none of that power is getting transferred out of the set in the form of RF, ALL that heat must be dissipated or got rid of by the tube plate and other elements (glass, plate top cap, and base).

So if your tubes are rated at 25 watts plate dissipation, and you are running 24 watts just at SSB idle, not much left is there? That would be the case for the 6146, -A, and -W versions.

Never fear however; the 6146, of any version, is built to take some abuse; That's why the 6146, 6146A and 6146W do just fine in the Kenwood hybrids. The trick to making these tubes last a long time, as with any other tube, is to keep tune-up times as short as possible.

Same rules apply to rigs with the B series of tubes; you just have a bit more time to play with, is all.

Now running SSB on any version of tube is not a problem. Average dissipation only increases about 20 percent, and that is just on voice syllables, so you are really not beating hell out of the tubes on voice.

CW runs a little higher on average, but again since it's not 100 percent duty cycle like AM, FM, PSK or

RTTY, you are still OK.

If you are going to run PSK, AM, or FM, at any carrier level exceeding about ten watts, you need to upgrade to 6146B tubes and reneutralize.

If you are going to do the high-power mod, in which the screen voltage is jacked up for higher output, you will also need to go to the 6146B. I have used the 6146W for such a mod, by customer's request, but I am more comfortable with a fresh pair of 6146Bs in such a situation.

I think he's referring to the spurious output that comes from improper neutralization (not necessarily harmonically related) which, of course, often results in excessive plate dissipation. Bill, you can explain things much better than I...

2901. Re: One more question ts820?

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-12-03 15:17:35 UTC
From: Walter A. Breining
Topic: 2866 Message: 2901

Hello Jim:

I'm glad that that solved the problem. I hope it didn't seem like I was giving you the run around, but I didn't know how much you
knew and I was afraid that you had a short to ground between the two tubes, causing one to be getting 12V on a 6V filament. This would have caused a new tube either to loose its filament or would have quickly damaged the cathode. Since both tubes now light, you are past this problem.

I assume that you have seen the posts on here answering my questions about 6146 tubes. There is an article that says that 6146B tubes don't work very well but everybody else seems to be using them without any problems.

I suspect the writer of the article may be using them on frequencies much higher than 30 MHz and they may have slightly different inter-electrode capacitance than the older ones. Probably the range of the neutralization circuit in the Kenwood radios is intentionally designed wide enough to accommodate 6146B tubes well.

If your 6146A tubes are good, they should work just fine. If you are getting 80 to 90 watts on 28.300 CW with the rig properly tuned up and the carrier control full up they are fine.

Be sure to have the final cage back together and reset the idle current back to 60 Ma. This will change now that you have good tubes.

I have used both 6146 A, B, and W tubes in 820s without problems over the years, but my experience is limited to 4 or 5 820s that I and close friends have owned so I wanted the opinions of the group.

If you do decide to get new 6146 tubes, you can get them at RF parts or surplus sales, see the posts from others on the web.

Do you know how to neutralize the tubes? It must be done with the final cage on. High voltages are present on the neutralization cap so be careful.

Now about your readout, first, be sure the VFO plug on the back is all the way in. There is a little power supply board mounted just behind the readout circuit box. Be sure the plug is on this correctly and check the underside of the board for cracked solder connections particularly at the base of the big transistor (actually a 5v regulator IC). Be sure

the plugs to the main readout circuit box are plugged in properly.

In none of this helps there are issues involving bad grounds and interconnect plugs inside the readout circuit box. But lets go there if the above does not work.

Good luck on your General tomorrow!

Vy 73, Walt N9WB

Hi Folks,

I have a TS-820S for sale. It is in very good shape. I have only had it for a few months myself.

I have the original box, manual and power cord. The hand mic is a replacement that I got with it. It says Ray Jefferson on the mic.

I have two extra sets of output tubes and three extra driver tubes. I will check on the exact model numbers on the tubes at home tonight. I also have two packages of the meters lamps from Radio Shack.

I am asking $350 Canadian which is $300 US.

Thanks,
Steve Phillips

2903. TS-820s Noisy receive

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-12-03 19:37:53 UTC
From: tetrodehead
Topic: 2903 Message: 2903

Hi all,

Great discussion on the 6164 series!

On receive, my rig seems to have excessive and consistent 'white'
noise on all bands.
I tried with a dummy load connected and have the same noise as
follows:
AF gain 2, RF gain 10 = loud noise.
AF gain 10, RF gain 0 = no noise.
Noise increases with RF gain.

Does it need the caps replacement fix?

Cheers Dave

2904. Calibration

Topic: 2903 Message: 2904

What does this mean...other than I need to adjust something...When I switch my ts-520s to the CAL-25 position I find that the tones generated to not fall at 25 kHz intervals (according to the dial at least). It seems more like 28 or 29 kHz intervals. I would assume this is not normal. I have read through the owners manual twice and am not sure I am seeing what I need to adjust. I would imagine the is a simple turn of a screw kind of adjustment but I am not finding what I need to adjust. Is there a spot for the required tweakage?

Thanks yet again guys,

Sean - WA2LKV

Peter,
If he really means what he is saying, then dial calibration is not his problem.
He says the calibrator comes in at 28-29kHz intervals, not the proper 25 kHz intervals. This would mean he has a 28 or 29kHz calibrator now and would indicate a problem in the calibrator circuit, I would think..

Peter and Paul
One should use WWV or the Canadian Research Council tmi clocks to verify if th emarker is off frequency. If the marker is crystal controlled I don't see how it can be that far off. I personally think its the main dial scale that for some reson moved or some additional C was introduced into the vfo. Maybe a cap gone bad or a solder connection becoming faulty.

No, no, that is not the problem...If I calibrate the dial for instance to zero beat a marker tone at 0 then when 25 comes around on the dial there is not a marker tone. The next marker tone zeros at about 29. I know how to set the dial but I can not figure out how to make the CAL-25 tone increments fall on the 25 increments on the dial. Hope that makes sense.

Yes, that is what I mean. I do not know the problem but you are correct the intervals are more like 29 kHz than 25 kHz...still seems like there should be a divide circuit or something I could tweak with a trimmer pot of some kind to adjust this.

I agree. The first thing to do would be to tune in wwv, slightly off zerobeat so you can hear the carrier, turn the calibrator on, then tune the calibrator adjustment such that it makes the same tone. Try it out and see if the calibrator works every 25 kHz as it should. If not, then perhaps the problem lies elsewhere.

Ok but
What IM suggesting is that you determine whether you marker is working correctly or not. I would try to Get wwv and them turn on the marker. If its right the marker should sit pretty much on top of WWV. If its off then it will be way down the dial.
Question: When you set the dail to 0 at the first 25Khz does the second '25Khz' appear at 29Khz then 54Khz and 83Khz or do they appear at 29, 58, 87 etc ?

I had the same problem with my TS-820s. I my caes, in the TUNE position, I got a "hardly noticable" amount of meter movment in both the RF, and IC METER positions. I have some posts to the group that explain the problem in detail. Maybe you can do a search (by group name) for all my postings to the group.

Bill made a recommandation which was to look for a bad resistor on the voltage dividing network on the PS board. See Bills reply post, if you can find it....or he may have included it in the FILES section of common problems and their fix.

Please note that the original equipment resistor did not appear burnt and testing it with an ohm meter actually gave a resistance reading, but the readings where intermittant, and seemed to vary in value, every time I tested it with my DMM (out of cct of course)...BTW, this taught me a lesson in testing resistors!!!

So replacing it gave me the 10 watts of beuatiful tune up power required to get nice meter movment in the TUNE postion. I no longer have to tune up using the CW postion at the full 100 Watts..While this may not be the cause of your problem, it may be a good place to test.

Just to clear-up my lasr reply, in helping you compare problems: in my case I got no meter movement (or just a "hair" if you looked very closly) in ALL the meter positions. Not only when trying to tune, with the METER switch in RF and IP positions, but also in the ALC postion.

Does your meter needle remain dead when trying to tune (while in TUNE not CW) in all these METER switch positons? If so, it may be the same bad resistor in the voltage divider, as I experienced.

Sean,

I don't know if you understood my earlier message, but it sounds like the calibrator is giving you markers every 28-29 kHz, instead of every 25. The calibrator adjustment procedure out of the Service manual, section 3-20, says to tune in WWV for zerobeat (the carrier, not the audio tone they transmit), then adjust TC1 on the marker board until it is zeroed with wwv also. I don't know how much range capacitor TC1 has, so it adjustment of that doesn't work, perhaps another component is giving you a problem.

Let me know if the marker calibration works.

73,

Eric

Wayne,

My input is probably off track, but may be something you wouldn't think of. Pardon me, also, if it doesn't apply to your TS-530S.

A number of years ago, I made my TS-520 into a bit of a "hot-rod." One of the mods I did was to install the Fox-Tango cascade filter set, which gave me 16 poles of filtering. I also installed a (too narrow) 250 Hz filter for CW.

If memory serves, it was the 250 Hz filter that caused my 520 to not work in the "TUNE" position, since it has a high insertion loss.

Maybe your rig has a similar tight filter.

73,

Eric KA8FAN

Topic: 2922 Message: 2923

When I run my iambic paddle on my TS-830, I use a Logikit CMOS-4 keyer by Idion Press. It has a jumper inside on the board that allows you to switch from solid state and Grid Block (for tube rigs like the 830). I plug the paddles into the keyer and the keyer plugs into the rig..simple and your speed control and memories are right on the keyer. Take a look at the reviews for this keyer on Eham, it is rated very highly. Good luck

Was that the 470 ohm resistor that supplies the 210
from the 300v supply?

Make sure you don't "overrate" the power on this thing
when replacing; it's really a fuse! hi.

From: Bill K0ZL
Topic: 2922 Message: 2927

The 830 does not have a built in keyer; you will need
a keyer box between the paddle and the rig. The
Vibroplex is a very fine set of paddles by the way, so
it's worth it.

You can build your own based on the Curtis 8044ABM
chip (just google that for 8044abm kits, keyers, etc)
OR you can "buy the box" from MFJ or one of the other
manuf's for less than 100 bux.

Connect one side and turn it sideways.

Seriously, you have grid block keying and you will either have to purchase a keyer with a jumper option for it or get one of the old keyers used, which can be a problem, as many of them have been modified for new rigs. Another route is a grid block adaptor, about ten bucks.

I have had better luck with the built in on my icom 718 than the MFJ. The MFJ deluxe tends to add a character here and there, making you question your own ability.

2932. Rig DOA - Help!!!

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-12-05 18:53:46 UTC
From: Jim
Topic: 2932 Message: 2932

I moved about a month ago and have finally gotten all the boxes unpacked. Just before I file the insurance claim, I figured I should plug in the old 820S just to be sure.

Unfortunately, it looks at though the movers did not do it any favors. The digital display, which worked fine other than the rare flashing segment problem, does not light up. Not at all, even when warmed up I can connect to a dipole and get white noise, but nothing that resembles a signal. When I connect to the dummy load and try to tune, it seems the transmitter is non-functional as well.

Is there something that is likely to be causing all these symptoms, or are there several problems here? I can manage one problem at a time, but this one has me stumped.

73,
Jim

Richard,

One suspect is located in the power supply section. Look for a small board marked "HV UNIT" or something similar. There is a voltage divider which provides a lowered voltage to the screens while in TUNE mode. It's probably the resistor that is not grounded and has gone high or open.

My 820 is in need of a tx relay it has a Omron MH4p in it.
Have taken it out to clean contacts and one set of the contacts is
almost completely gone. Does any one know where the best place to
order relay sets from?

Check all the inline connectors on the front of the
PLL unit, underneath the rig, front edge, hidden under
the wiring harness. One could have come loose in the
move.

Using a millivoltmeter or scope is possible, just turn the SG switch off in the back. This, after tuning for max output first. Then turn off the switch and go back into TX mode. The neutralizing cap would then be adjusted for a null on the output.

I have never done it this way so be careful.

I usually just adjust neut. cap so that dip and max output occur at the same point, or so that the plate current "humps" on either side of resonance are the same.

2944. Re: [TS-520_820_530_830] Finals ts820

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-12-06 10:30:37 UTC
From: Walt Breining
Topic: 2937 Message: 2944

Jim:
If you have a TS-820 owner's manual the procedure for neutralizing the final is on page 6.4 at the bottom of the page.

Why neutralize? Tubes have internal capacitance between the elements. Positive feedback can result causing unwanted oscillations that can cause serious mischief. If we can use a capacitor to create negative feedback equal and opposite to the positive feedback, we can eliminate these unwanted oscillations.

You must have the covers on the final cage because if you adjust neutralization with it off, it will change slightly when they are replaced. There is an access hole for this purpose.

First, see if you are already neutralized. Kenwood specifies using 21.300 on 15 meters for this so you should be near this frequency. Bill mentioned a method of determining if the system is in a neutralized condition. First, tune up the rig on 21.3 through a wattmeter into a dummy load for full power on CW. Keep your key up time short. Place the meter switch on IP. (Plate current) Slightly rotate the plate control past the peak in watts on the wattmeter clockwise and then counter clockwise. The Plate current IP should dip to minimum at the exact same point that the wattmeter peaks. If you meet this test, on or near 21.3 MHz, you probably do not need to adjust the neutralization capacitor. Also note that this condition will not always occur closely on other bands removed from 21.3. Multi band rigs are sometimes a compromise and if it is in neutralization on 21.3 MHz, it will be close enough everywhere else.

If you do not pass the above test, the neutralization capacitor can be nudged one way or the other until this condition occurs on 21.3 MHz.

If the above test indicates that re-neutralization is necessary, another method of adjusting the capacitor is provided by Kenwood on the TS 820. On the back there is a SG (Screen Grid) switch. If it is placed in the down position, The positive voltage is removed from the screen grid and replaced by a negative voltage. This keeps the tube from conducting. Any small signal that appears on the output will be signal from the driver that leaks through the final tubes due to inter-electrode capacitance.

The problem is that you cannot observe this small of a signal on the wattmeter. One method is to connect the scope to the output along with a dummy load. This can be done with a Tee connector.

Another method is to use one of those cheap SWR meters like the ones used for CB that has a forward power adjustment. It does not have to be accurate, as all you need is a relative forward power indication. Put the meter in line after the rig on forward power and with the rig still in a tuned up position on 21.3 MHz, place the SG switch down and advance the forward power adjust for an indication on the meter. Now you can adjust the neutralization capacitor for minimum reading. This mimics the diode/ meter method in the book.

I should mention that adjustment of this capacitor is tricky. First note that it has high voltage on it. If you use a metal screwdriver and it touches the capacitor and becomes grounded to the edge of the hole in the final cage, bad things will happen and you will hate it. If you touch the capacitor with a metal screwdriver and touch the metal part of the screwdriver with your fingers, you could be killed. Also, the metal screwdriver will change the value of the capacitor and you will no longer be in a minimum condition when it is removed.

A plastic or nylon tool is required. The capacitor turned fairly stiff and sometimes the tool will break before it turns. If you use a plastic tool with a small metal blade, the blade will affect the capacitor so you will need to nudge the capacitor slightly and remove the tool to get your reading. With some patience you can get it adjusted right.

In cases where the capacitor was way stiff, I placed a tiny bit of WD 40 on the shaft and exercised it with a metal screwdriver before adjusting it. Of course unplug the radio and discharge the voltage before using the metal screwdriver and the WD-40.

One last note, the final will not be drawing plate current with the SG switch down so you can keep the radio on transmit longer without overheating the tubes.

Be sure to put the SG switch back up when finished or you will be wondering why you have no output.

Vy 73, Walt, N9WB

Hello all, Tnx for the great help on my rig!!! esp Walt.. I have 1
more question if u guys dont mind. I dont have a rf milivolt
meter.can I neutrilize the PAs withe the scope i have?.. it is a BK
40 meg scope I use just for audio testing...Tnx Jim KD4LOW..

2948. Re: [TS-520_820_530_830] Calibration

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-12-06 20:01:18 UTC
From: Richard Harris
Topic: 2903 Message: 2948

Bill,

The calibrator for the TS520 uses a crystal oscillator and a locked multi-vibrator divider (Q2 and Q3 of Marker Unit PCB X52-0005-01), This is "digi-log" rather than purely digital (in the sense of an IC which can only divide by a certain number) and so could lock to another sub-multiple if components have aged. I had exactly this problem with my TS-510 (which uses a similar circuit) because the previous owner had made a modification that changed the supply voltage to the calibrator circuit - and it was dividing by three (i.e. 33kHz markers) from the 100kHz crystal oscillator, rather than dividing by four (25kHz markers). I undid the modification and it then correctly divided by four.

However, in this case I am not so sure because the harmonics are reported at 28 or 29 kHz intervals, but dividing by other integers is certainly possible with this type of circuit and worth bearing in mind.

Sorry, I cant remeber the value, or exactly "R #" I replaced, but I replaced it with the same value....It was on the HV UNIT Board. (The board is labled X43-11140-00)

I would have to open up my rig to take a look .....I would suggest he pull out the HV board and test them all...(Thinking about replacing it now, I beleve one side of the resistor did go to ground)

Go the Message #1930 on this group for the thread that adressed my repair.

I HATE to really beat the hell out of this!!! I was just re-reading my old post and the resistor I replaced was one of 2-56K units. BUT, Bill had originaly told me to check the RECT UNIT Board (X43-1090-00), NOT the HV Board, yet my hand notes say I should check the HV board...which one the bad resistor was on, I can't remeber!!! I think it WAS on the RECT board, not the HV Board (I seem to remeber diodes on it)...I don't have the schematic with me....which one has the voltage divider on it?

Greg.(losing my mind)

Hi all!
I have a ts 820s thats is possessed!!
only on the 3.5 band (75-80 meter)whith the power on and receiving.
The display will start to drift up or down ,then go nuts like
showing 29.9999,the goes out.
And when I tip the rig it will come back on,and it will do it all
over again.
Have cleaned the band switch (in the fanal box too)and the af avr
board also.
But it is still is up to its tricks.
can someone help me?
73s for now

I have never had a failure on the HV board, which is
just a voltage divider to derive the HV metering
voltage and the proper tube screen voltage based on
what mode you are in. That does have two each 56K
resistors. The majority of the problems I have seen
are with R6 on the RECT unit; this is the dropping
resistor for the screen supply to the tubes; it is how
210A is developed for the screen supply. R6 will
often burn open if the tubes are bad; as will R6 and
R5, 100 ohm 1/2 watt resistors on the PA tubes.

Everyone seems to have their favorites.

You can get a good working Wavetek 3000 generator for under 500 bucks on eBay. And you can't beat any of the 100 meg dual-trace scopes out there.

I use the Wavetek 3000B service monitor which is combined sig generator and FM/AM modulation monitor for up to 1000 megs. Paid 3500 for it about 15 yrs ago, now available for less than 700 in working condition.

I use the Tektronix T-922 scope, 0-15 megahertz dual trace. the T-932 is 0-30 and quite adequate for most ham work; tek scopes usually work up to twice their stated freq range at minus 3 db response; so if you are looking at relative readings (does this amp have gain or loss? is the oscillator oscing?) they are fine above their rated freq. These scopes with probes are under 200 and don't take much desk space, being longer than wide .

2956. TS-820s Connectors

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-12-09 19:45:53 UTC
From: tetrodehead
Topic: 2956 Message: 2956

Hi all,

Please help! I'm in double trouble!

Trouble 1.
Whilst cleaning connectors, I removed the plug from CJ1 on the CAR ASSY UNIT X60-1000-00. I failed to note the following:
CJ1 has 4 pins. According to the schematic, pins 2 & 3 are inter-connected on the board.
The mating plug has only 3 slots. Slots 1 & 3 are jumpered by a black wire.

Question: Does the plug engage pins 1,2 & 3 or pins 2, 3 & 4?

As there are at least two plugs like this in the rig, I suspect that I'm not the first to make this daft mistake!

Trouble 2.
I removed the driver tube and discovered a silvery strip which looks like a ground for the metal tube shroud. How do I get it back in the shroud when refitting the tube??

Cheers
Dave

AS for the driver shield. I usually do not replace the
driver shield. this helps the cooling of the driver
tube and has never caused a problem.

Thanks Bill.

The attached poor photo shows the connector in question, right by the little square hole in the chassis where the shaft coupling peeps out.
If you squint, you can see 'spare' pin 1 .
Pin 1 or pin 4 open?

Cheers
Dave

Larry,
Welcome aboard! I'm sure you're excited about upgrading, and I'm excited about getting another 5-land CW operator (that's why you're upgrading, right?).

While we like living in the flatlands of Central OK, we also enjoy our visits to NM, particularly to Philmont. It'd be fun to work a portable from atop Wheeler, or even Baldy ...

I'm looking forward to hearing you on 40 or 20 CW.

Good luck tomorrow,
Jim

2962. TS-520SE Use of Carrier Control

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-12-10 15:45:18 UTC
From: ke4we
Topic: 2962 Message: 2962

Hello Everyone-

I have a TS-520SE and have been preparing to get it on the air for several weeks. Just got the antenna up this week.

I have been 'practicing' tuning the rig (into a dummy load of course) and everything seems to being going good.

My concern is the correct use of the Carrier Control. When performing the Drive Tuning, I place the control around 2-3 which provides approx. 2/3 scale reading.

Should there be any further change in the control (CW or SSB)??

Thanks,
Gordon
KE4WE

2963. Re: TS-520SE Use of Carrier Control

Yahoo group: TS-520_820_530_830 (2001 — 2004)

From: n6ayj
Topic: 2962 Message: 2963

Gordon, I think the "carrier" control on the '820 is essentially analogous to what is called the "drive" control in most other transceivers. You simply adjust it for about 230 ma of plate current on the 6146's, at the dip in CW mode.

2964. Re: [TS-520_820_530_830] TS-520SE Use of Carrier Control

In SSB, the carrier control doesn't matter; not in the
circuit.

In CW, you set the carrier control to desired output.

Try 25-40 watts for CW, it's usually as effective as
100 watts.

I will often start a QSO at 25 watts, then work down
to 5 watts or less. It's always surprising for the
non-QRP guys how well it works! hi.

Bill,
Would the correct procedure for reducing the output be using the
Carrier Control or the Drive Control???
Thanks,
Gordon

Carrier control. Leave the drive control peaked; that
is your resonant circuit for the driver tube grid and
plate, and the final grids. Having it out of resonance
will shorten the life of your driver tube and possibly
allow spurious energy in your transmission.

Anyone know where I can by some paint to redo a Kenwood transverter case, that will come close to matching the orginal color?

Thanks, John n5nme

2974. Unusual display problem with 820s

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-12-13 04:22:06 UTC
From: ka9inv
Topic: 2974 Message: 2974

Hello all,

I just bought a TS-820s for my first HF rig, and unfortunately I'm encountering difficulty right out of the package. I am a relatively new ham who just upgraded to General class, so radio repair is insofar not one of my strong points - I honestly cannot figure out what the problem is, and I hope I'm not missing something obvious. My apologies if this is somewhere else on this site, although I searched and didn't find anything quite like this.

Anyway... I am having a strange problem with the DG-1 display. It has all of the normal symptoms that people normally complain about, except that I have cleaned the contacts and have reseated the connector a number of times, to no avail. Additionally, when the display does decide to function correctly, a strange thing occurs: the display shows a frequency BELOW the selected band, not above! For instance, if the dial shows 100 and I'm on the 40m band, the digital display will say that I'm on 6.900.0 instead of 7.100.0!

Anybody with a little more experience than I care to offer some possible solutions?

Thanks and 73s,

Sal KA9INV

(This post might look familiar to anybody who frequents Eham... I thought I'd try there first before asking a question that's probably been answered in one form or another here, hi!)

2975. Re: [TS-520_820_530_830] Unusual display problem with 820s

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-12-13 12:49:56 UTC
From: Dave & Loraine
Topic: 2974 Message: 2975

Hi Sal,
I sympathise!
My 820s has a similar problem which we ain't solved yet!

I cleaned all connectors and inter-board connectors and all switches.
The mechanical tuning works accurately on all bands.
The 10MHz digit switches correctly.
The 1MHz digit shows 9 on 1.8 thru 14, and shows 8 on 21 thru 29.5 and WWV.
The first and second decimal MHz digits are locked on zero.
The third decimal MHz digit counts from zero to 3 then starts over from
zero.
The last decimal digit counts normally.
Go figure...

Ideas from the group would be appreciated

Dave

Hello Sal;
I have a 820s that has a brain of its own when it comes to the display
I have done everything Dave has done also to mine. It will work great
and when it wants too it will drop a # on any digit and then add a #
The next time I turn it on it runs like a champ.

Hello everyone,

Congrats to Larry on your upgrade to General! And, thank you to
Richard G3OTK for the website; I had not seen that page before.

An update...
First, I have resolved to get a more experienced ham to help me
with resoldering those connections. I don't trust myself to do it --
I have a nasty tendency to overheat boards and cause the foil to
start peeling off. Not a good thing, of course, so I have to find
someone who actually is good at it to help me out.
Secondly, now I have another problem. Not only is the display
refusing to come on at all, but now instead of the usual static, all
I'm hearing is an odd buzz -- though not quite an AC hum. Be that as
it may, might this be due to a poor ground?

Again, thanks Richard. Hopefully something on that website will get
the display functioning correctly. From the reviews I've read, the
headaches I've had so far with the TS-820S will be worth it. :)

Sal:

It looks like you may have two problems. The erratic display is one and the dead display radio the second.

There is a round VFO plug on the back of the 820. A VFO or a dummy plug must be plugged in tight. If it is not the radio and display will be dead except for a little audio noise.

If the VFO plug is lose or out, fixing this will bring you back to the erratic display. Every little bit helps.

From: Richard Harris
Topic: 2974 Message: 2981

Dave,

Is this a DG-1 unit, the same type as mentioned in Sal's e-mail? I can't find a circuit on the web (but see below). Since it must be more than 20 years old then the counter ICs just might be small scale e.g 74 series TTL. My guess as to what is happening is as follows:-

The signal that is being counted will go to the divider for the right hand-most digit (kHz?) (which seems to count OK) and the carry from that divider will go to the second from the right (10s of kHz?). From your description, the two least significant bits of that counter are getting to the decoder for that digit but not the most significant two bits, so it counts just 0, 1, 2 or 3. The carry from the counter for that digit isn't getting to the third digit from the right (100s of kHz?) and so those stay on zero. The left hand digit probably has a number pre-loaded just before the count starts and that is why you see either an 8 or a 9.

If it is the DG1 that you have
then www.mods.dk/view.php?ArticleId=1543
www.mods.dk/view.php?ArticleId=1564 and
www.mods.dk/view.php?ArticleId=1537 may help. The implication is that the DG5 is similar to the DG1 and the site contains the manual (including circuit) for the DG5, so that may help as well. The download is very slow, so grab yourself a coffee! The counters appear to be straight forward BCD, although I haven't found a part number yet. I will try to work my way through it later.

So I suggest that you try to locate the counter IC for the second digit from the right and re-solder the pins - the link that I posted yesterday to an NZ web site and the links above say that solder joints of DG-1 are not that reliable. If that doesn't work, then replace it if you can find a suitable part.

Good luck

Dave,

Is this a DG-1 unit, the same type as mentioned in Sal's e-mail? I can't find a circuit on the web (but see below). Since it must be more than 20 years old then the counter ICs just might be small scale e.g 74 series TTL. My guess as to what is happening is as follows:- Snip:
Thank You Richard. This is going to be very helpful to me also!

Vy 73, Walt N9WB

Thanks Richard

The display is DG1A according to the 820s manual.

I appreciate your logic re the logic board!
I've re-soldered all the thru-hole points and the inter-board connectors as per NZ but no change..

I'll look at the links and the ICs tonight.
Thanks again for your help.
Dave

Dave,

It looks like the counter ICs are 74LS90. There are available from at least one UK broad line distributor (Farnell Electronics, the company that owns Newark in the States, which I believe is one of your major distributors) - that was the first catalog that I looked at. I hope to study the circuit of the DG-5 to night to get a better idea of how it works. So spare ICs may not be a problem.

Incidentally, I believe that Service Manual for the TS820 is available from www.mods.dk but it is 16MB, so an overnight download would seem to be in order. I started to download it but the site was only sending out a few kB per second and I gave up when the predicted download time was over 1 hour.

73,

Richard G3OTK

I have been checking around the output stage of mt TS-530,follwing an
article in the this months RADCOM magazine.
Preliminary tests indicate R7/R8 100ohm are different by 30%.
I will probably change these,but what resistor type would be best.
I presume doing this will make sure both valves are doing equal
amount of work.
Regards
Bob

Topic: 2974 Message: 2992

Hi Dave,

I have looked at the circuit that I downloaded and it is much as I expected. The design must date from about the mid-'70s and I was designing circuits at that time with the same types of ICs - rather like meeting old friends after all these years!

I have worked my way through the circuit and understand most of it - a brief description appears below. The ICs are either Texas Instrument's TTL or what I assume to be Japanese equivalents - the part codes are a little different but I don't think that matters. The TD34**AP that you mention in your other e-mail is, I believe, equivalent to 74** - for example, a TD3400AP is equivalent to a 7400. Many of these I recognise, the rest I have forgotten! There is a lot of electronics in this box but at least most of the parts are available, or there are suitable alternatives, so it should be maintainable. Which is more than can be said for more modern equipment.

I have some questions for you.

1. The circuit that I down loaded is said to be the DG-5. Can you confirm you have the DG-1? The download (which doesn't have DG-1 or DG-5 printed anywhere) states that it is used with the TS-520. Maybe someone in the group can list the major differences between the TS-520 and the TS-820.

2. How many digits are there is the display? The schematic that I downloaded shows six digits.

3. Are there connectors on the back for "HET", "CAR" and "VFO"? What other connectors are there? Are there any switches? If so what are the markings?

4. With standard TTL ICs it should be possible to track waveforms through the counters. Do you have an oscilloscope available (say at least 20MHz bandwidth)?

There are two 6 digit BCD counter chains, using 7490 TTL ICs. One chain counts the "HET" oscillator. The 4 bit BCD outputs from this chain of counters are loaded into the preset inputs of the second chain which counts the frequency of the VFO mixed with the carrier oscillator (I assume that is the oscillator associated with the filter - there is a dual-gate MOSFET which performs the mixing function) I don't think that is all of the story as far as the input signal to this counter chain is concerned but I don't know the frequencies used in the TS-820 (I have a TS-530), so it may be a little more involved. The second chain therefore has an output that this the sum of the HET oscillator and the VFO + Carrier.

At the end of the counting period the six BCD outputs from the second counting chain are latched in six 4-bit latches (74LS75). Latching the outputs means that the display is steady and you don't see it counting.

Working back from the display. This is a six digit seven segment display which is multiplexed, one digit at a time, that is each digit is displayed for 1/6 of the time. The segments are driven by a BCD to seven segment decoder IC (74247) and the appropriate 4 bits from the six latches are selected by a series of multiplexers.

I can provide further detail if required.

Topic: 2974 Message: 2993

Hi Richard,

1) The display is DG1.
Maybe someone in the group can list the major differences between the TS-520 and the TS-820.

2) 6 digits.(also on the far left is a -ve symbol not in use)
TS-820s has 1.8, 3.5, 7, 14, 15, 21, 28, 28.5, 29, 29.5MHz via the bandswitch.
Tuning adds 0 - 500kHz to these frequencies.

3) One input connector on the bottom and one output connector on the top to the display.
The schematic identifies the inputs but my poor copy does not show "HET", VFO or CAR.
No switches.

4) I've only got an old 10MHz scope. Would that be of any use for tracking?

Thanks for the description of the logic.
I can email you my .pdf manual (a couple of Meg) if that would help.

Cheers
Dave

From: Richard Harris
Topic: 2974 Message: 2997

Dave,

Its probable that the circuit that I downloaded will be very similar to the DG-1 even if it is a DG-5. I think it is unlikely that Kenwood would have two completely different designs. Does the PCB layout (IC locations etc) look like that in the downloaded document?

A 10MHz scope should be fine. For a start I suggest just going along the counter chain looking for pulses. If there are pulses on the input to a counter but no carry to the next stage then that may be the problem IC. From your earlier description of the fault, IC21 is current favourite.

I would appreciate a copy of the manual. Can you e-mail me directly? Maybe we should carry this correspondence outside of the group - we could copy anyone else who may be interested.

Richard:

I would appreciate it if you could copy me with the continuance of this discussion if you go outside the group. I had a TS-820 that had the same or a similar problem. It occurred at about the time I was going through a divorce. I had to put the 820 in storage and over the years it was destroyed by acid due to an accident. Using it for parts, I restored two "beyond repair" Kenwood 820s. The readout in them works fine so far but it is likely that I might encounter the problem again.

Although I am a former broadcast engineer and repair technician, this type of TTL circuitry is my technical weakness. It is hard to find a good explanation of how to go about troubleshooting this type of circuit. I have already printed two of your messages and placed them in my service manual.

One of my 820's does have a slight readout problem. The last digit wanders +/- 3 digits only on 160. The radio itself is not moving. I suspect one of the signal levels is slightly low to the counter and plan to look into this over the next couple of weeks.

Dave,

Maybe we should carry this correspondence outside of the group -
we could copy anyone else who may be interested.

Richard

3001. "Hot" rigs ...

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-12-16 13:44:22 UTC
From: jimbart
Topic: 3001 Message: 3001

I thought I read somewhere about someone getting 'bitten' by the rig.
Checking the database, it seems that problem isn't egg-zackly mine.
Situation: TS830S; VOX = On; Mode = CW; 3-conductor line cord,
grounded; key = Vibroplex "Original" bug, not keyer.
Problem: If I try to adjust either CAR or RF Gain while keying, I get
this hot little buzz in my finger ...
Fix: The obvious is avoidance: don't adjust a metal knob while
keying.
But, this is a bit disconcerting & I'd like to consider remedy
instead of avoidance.
Inquirin' minds wanna know ...
Thanks,
Jim

You have RF in the shack, common problem.

What antenna you running? What band?

Hi Bill(N6AYJ),

Thanks for your kind offer.
Please send to:
D Crooks
La Petite Besage
24240 THENAC
France
(or email if you prefer)
I will gladly pay your costs.

Jason,
Please send a copy to Richard as kindly offered.
I'll pay your costs.

We'll then be singing from the same hymsheet and should be able to fix this problem.
As Bill suggested, we'll continue online.

Thanks to all for a great group.

Dave

3006. TS-830s with TenTec 6 and 2 meter transverters

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-12-16 17:51:28 UTC
From: Bruce H. McIntosh
Topic: 3006 Message: 3006

I've searched the group archive and not gotten any hits, so...

Anyone gone down the road of using those little hundred-dollar TenTec VHF transverters with a TS-830s? Success? Failure? And I guess this'd likely bring up the side question of the most effective means of reducing the power out on the 830. I've seen mention of monkeying with the ALC voltage to reduce drive without compromising ssb audio quality. I got to thinking, "wouldn't it be cool to convert that "Fixed oscillator" button that nobody seems to use into a "QRP" button that'd back the rig down to 5-10W out at the push of a switch?" Is this a reasonable course to pursue, or am I flat off my rocker?

Bill,

Thanks for your advice - I didn''t know what the etiquette might be in this situation. There seems to be a number of members with an interest in the TS-820 and associated digital frequency display, so if Dave is happy to do some probing around in his unit then maybe between us we can get it fixed. Let me know if you get bored!

Do you know the differences between the DG1 and the DG5?

Bill,

That's very kind of you. The second offer we have had - this is a great discussion group. Jason, KB1JHL, is going to send me an electronic copy, although it is such a large file that it has to be sent in two parts. Bill, K0ZL, has suggested that we continue this thread rather than go off-line, so I will carry on posting here.

I wonder if anyone has a manual with schematic for a DG-1. Its intelligent guesses otherwise!

Hi Richard,
As you may have read, I've asked Jason to send you a copy and Bill to send me a copy.

My counter board X54-1160-00 has five TD3490 back-to-back with five TD3475.
Their PCB tracks indicate a chain.
If so, they are IC7-11 counters and IC12-16 latches?. Just a guess on my part!
My IC21 is one of only two TD3460 on the board.
Should we rather be looking at either IC8 or IC10 as the suspect?
This is pushing my envelope much better! Your guidance is invaluable.

I note that the feed for the counter assy includes two coax (RF?) leads.
Which two of the three frequencies get HETrodyned before the counter assy?
I'll scope the two to see what's being sent.

Cheers
Dave

Hi gang
I'm glad that Bill suggested that this particular thread continue on the reflector. I too have a TS 820 sd. Now its working perfectly (almost.. a bit low audio on recieve) but sooner or later Murphy will pay me one of his frequent visits to my shack. My 820 is the most 'advanced' rig I have and I'm sure that he will be eyeing it! So the more I learn from you guys is my best protection against him.

Hi,
A keying relay, such as Chuck Olsen's (Jackson Harbor Press) "Keyall" solid state unit. The benefits include the isolation you need from the high voltage at the key and also being able to use any modern solid state keyer with your rig. Take a look at Chuck's site.

http://jacksonharbor.home.att.net/keyall.htm

I built one of these for my 520.

Hi Dave,

I have managed to download pin-outs of most of the ICs from the TI.com web site. I will be QRT on e-mail from this evening (Thursday) until Monday morning.

Can you take the cover off the unit and see if the component placement ties up with the DG5 download? If it doesn't, then perhaps you could sketch the IC positions and scan/e-mail it to me. Please note down IC types.

Taking the DG 5. The frequency reference is a 10MHz crystal oscillator and this is divided down to 10Hz using six 7490s. The gating time is 0.1 sec which means the resolution could be 10Hz, but isn't because the two counter chains start off with a divide-by-10 before the counter for the first (100Hz) digit. The "HET" input goes to one counter chain consisting of a 74196 decade counter followed by 6 of 7490. The outputs of these are parallel loaded into the other counter chain (for VFO + CAR) consisting of seven 74176 decade counters. The last six are parallel loaded into six 74LS75 four bit latches, then to the multiplexers and onto the seven-segment decoder and then to the display.

Can you identify these IC chains on the circuit board?

The 7490 counters are odd-balls because the power pins are not the corner pins. I think that dates them. They are two section counters, a divide-by-2 followed by a divide-by-5. The output of the first section (pin 12) is connected to the clock input of the second section (pin 1). The clock input to the first divide-by-2 stage is pin 14, so you could make a start by checking whether there are pulses at each pin 14 of these ICs. The pulses will be in bursts.

The 74196 counters are similar in concept (divide-by-2 and divide-by-5), although at least the power is on the corner pins as per most logic ICs. The clock inputs are on pin 8, so these are pins that you could check for pulse activity. Spare 74196 ICs may take some finding.

Let me know your results and I will give the problem some more thought.

73s

From: Richard Harris
Topic: 2974 Message: 3014

Dave,

I should have looked for incoming mail before I sent the e-mail that has
just gone. It looks like there are considerable differences between the
DG5 and the DG1. The other e-mail contains a brief description of the 7490
which must be the equivalent of the TD3490. The TD3475 will be equivalent
to a 7475 although the -5 uses the LS version. So your guess was inspired!

So can you check the input clock (pin 14) to the '90's for pulse
activity? You might also check the QA output (pin 12), the QB (pin 9), the
QC (pin 8) and the QD (pin11). All of these should have pulses (probably
in bursts), with decreasing frequency progressing QA to QD.

I haven't been able to find a pin-out for the TD3460 (or 7460). Ignore my
earlier guess of IC21 because the DG1 is obviously quite different to the
DG5. I've changed my guess to IC8!

From: Dave & Loraine
Topic: 2974 Message: 3015

Hi Richard,
I have pulses on pin 14 and others on ICs 7 & 8 but not on ICs 9,10 or 11.
I'll check for output from IC8. If OK I'll check the track/soldering to IC 9
if that's the right direction.

Thanks
Dave

3016. Re: [TS-520_820_530_830] Unusual display problem with 820s

Yahoo group: TS-520_820_530_830 (2001 — 2004)

From: Dave & Loraine
Topic: 2974 Message: 3016

R,
On ICs 6 & 7 I have pulses on those pins.
On IC 8, I have a pulse on pin 8 only. The other pins are flat-line.
No pulses on ICs 9, 10 or 11.
D

3017. Re: [TS-520_820_530_830] Unusual display problem with 820s

From: Dave & Loraine
Topic: 2974 Message: 3018

R,
I'm loosing it...
These are the certain facts!
IC7 has pulse activity on 14, 12 and 8. Nothing on 9 and 11.
Same for IC8.
ICs 9, 10 and 11 have none.

A thousand apologies for the bad info.

Antennas in the attic are surefire way to get some
fire in the shack, hi!

Whatever band(s) you are getting bit on, cut 1/4 wave
wires (33' on 40 and 16' on 20) and put them on the
ground screw of the rig. Start with one wire per band;
align it right angles to the antenna axis if you can.
that should reduce your RFI somewhat.

My TS-830S drives a SSB Electronic LT-6S 6 meter transverter using the transverter output connection on the back of the 830S. No diddling with ALC voltages. It's plug and play. Just wire up a Din plug and plug it into the back of the 830. SG switch is put into the off position. What's the drive requirements of the Ten-Tec transverters?

Pete, wa2cwa

On Thu, 16 Dec 2004 17:51:28 -0000 "Bruce H. McIntosh" <scotsman@...> writes:

I've searched the group archive and not gotten any hits, so...

Anyone gone down the road of using those little hundred-dollar TenTec VHF transverters with a TS-830s? Success? Failure? And I guess this'd likely bring up the side question of the most effective means of reducing the power out on the 830. I've seen mention of monkeying with the ALC voltage to reduce drive without compromising ssb audio quality. I got to thinking, "wouldn't it be cool to convert that "Fixed oscillator" button that nobody seems to use into a "QRP" button that'd back the rig down to 5-10W out at the push of a switch?" Is this a reasonable course to pursue, or am I flat off my rocker?

Hi jimbart...

How you fixed for a good earth ground? The effectiveness of such grounding will be related to the length of line between rig and ground... the shorter the better... I use 1" copper strap about 4' from rig to ground... and four 8' ground rods interconnected... Seems to me I remember that MFJ makes a little tuner (just a device to help create series resonance) that will let you "tune away" the RF that lingers... It even had a little meter that showed when max RF current was flowing... (desirable)... remember your theory... a 1/4 wavelength "antenna" has a very low impedance... that is the idea behind using wires trimmed to length... or just put in the little tuner and adjust the electrical lenth with knobs...

Also, it seems to me that the rig when keyed directly has some voltage (DC) across the contacts... hmmm... in that case, contact with the key and the case might give you a little tingle...

BTW I also run the TS-830, and love it to death... Bill worked mine over, and I get scads of power out of it... even with the bands dead, I am able to make consistent contacts... even ZS5 late last evening...

Also assume that you have CC&R issues for antennas... have you considered some "hidden" antennas using very thin wire... it becomes invisible from 30 feet away... and if it is ground fed, you can bury the feedline... (mine runs under a chicken wire ground screen) I use the mil surplus "flooded" stuff and it has been in or under the ground for two years now with no problems... any way there are lots of nifty antennas which work very well and are quite invisible... one of my favorites was the "flagpole" vertical... can be fiberglass with the various cut to length 1/4 wave sections inside, or can be made of metal, insulated by a coke bottle base (disguised) and fed at the base with a tuner... with a good ground system it is a great antenna...

Raleigh
NY0Y

jimbart <jimb@...> wrote:

I thought I read somewhere about someone getting 'bitten' by the rig.
Checking the database, it seems that problem isn't egg-zackly mine.
Situation: TS830S; VOX = On; Mode = CW; 3-conductor line cord,
grounded; key = Vibroplex "Original" bug, not keyer.
Problem: If I try to adjust either CAR or RF Gain while keying, I get
this hot little buzz in my finger ...
Fix: The obvious is avoidance: don't adjust a metal knob while
keying.
But, this is a bit disconcerting & I'd like to consider remedy
instead of avoidance.
Inquirin' minds wanna know ...
Thanks,
Jim

Hello Bruce,
The ten-tec 1210 will only take 1 to 10 watts input, so you would
have to power down the 830. I have one that has less than two hours
use on it. Not very much 2 meter sideband use here in New Mexico.
100% 2 Meter FM here.
Actually I was going to post it on Ebay this weekend for sale.

Hi,

I put the alc circuit in a tiny plastic case with a bat switch on top
and the 9v battery is cable tied to it. This gets velcro to the back
of the radio. If I want to use it I just flip the switch and verify
I am at low power.

I like your idea for a QRP switch, you could even use one of the
spare holes on the back of the radio for the qrp switch.

You can change the R5 resistor in the tentec 1208 to 4.7K and it can
take 10 watts input but not for FM modes or key down high duty cycles.

I did this so I can use it with my ts-50.

Lots of tentec transverters on ebay, eham, qth or available new.

Why would you have power it down? Why not just connect it to the transverter jack on the 830? The finals are not part of the equation. What am I missing here after doing it this way for the last 15 years? The transverter connection information is on page 18 of the operating manual including diagrams.

Thanks to Bill, Bill & Raleigh for comments & suggestions.

I'm still working out the layout & grounding scheme of the shack and so will be sure to do what I can about RF grounding. It's an issue I've not addressed seriously as yet, but obviously need to.

Echoing Raleigh's remarks, running the TS830S is a real joy: Just enough tube presence to remind me of my younger daze, plenty of power and a business-like look, sound and feel. The attic antenna, though up less than 20 feet, does a much better job than I expected. Been on the air since late November and so far have worked 26 states, but only two DX - Cuba & Azores - (all CW).

There aren't any CCR's to deal with (but I do have a wife) so I'm not bound to a stealthy antenna farm, but have chosen to start there. Been thinking about the flagpole idea for a while, because that (flagpole) figures into our landscaping plans for the near future.

I do enjoy and appreciate the chance to be here & thank everyone for their willingness to discuss our hobby (and help me overcome my ignorance!)

73,
Jim

Hi Pete,

The ten tec transverters do not have seperate input/output, they share a common connection.

Optional external attenuator and T-R relay connections could be used but that is beyond the scope of the kit.

The transverters can work with less then 1 watt drive, just have to swap out R5 per manual for the 1208 page 28

drive R5 value

.25w 820
.5 1200
1.0 1500
2.5 2700
5.0 3300 (default)
8.0 3900
10.0 4700 * (short cw or ssb only not for FM or high duty)

I think your creative thinking is great! I did a mod on my TS-520 years ago that uses the FIXED CHANNEL switch to switch in and out the 250 Hz cw filter. Maybe Kenwood should have labelled that switch as "SPARE FOR WHATEVER YOU WANT TO USE IT FOR."

I've searched the group archive and not gotten any hits, so...

Anyone gone down the road of using those little hundred-dollar TenTec VHF transverters with a TS-830s? Success? Failure? And I guess this'd likely bring up the side question of the most effective means of reducing the power out on the 830. I've seen mention of monkeying with the ALC voltage to reduce drive without compromising ssb audio quality. I got to thinking, "wouldn't it be cool to convert that "Fixed oscillator" button that nobody seems to use into a "QRP" button that'd back the rig down to 5-10W out at the push of a switch?" Is this a reasonable course to pursue, or am I flat off my rocker?

Thanks to Peter, Larry and James for the responses. If I'd looked closely enough at the manual I'd have noticed the transverter connector on the back panel. :-) I've got the TenTec units on my "wish list" for our family Christmas gift pool; if I don't get lucky I'll likely be in the market for one.

Hi Jim,

I'd start with a good ground. I'm assuming you were just using the ground pin on your power cord. There is a lot of good info on grounds, like the ARRL Handbook or Antenna Book. Generally, short, thick conductors less than 1/4 wavelength of the highest band you work. Anything 1/2 wavelength will not work well.

I live in a house with CCRs and a picky wife. My stealthy antenna goes across the top of the attic and outside. No hot rig with a good, short ground. If you do have problems after that, then a 1/4 wave counterpoise is a good idea (although you have more wire to hide from the wife!). The MFJ counterpoise tuner is a good choice, too.

The flagpole antenna is a good way to hide an antenna. In the early stages of your landscaping, get your ground radials buried. Then you can run your cable and install the antenna. Ought to make a good DX antenna.

830 transverter output is around .5 to .75 watts. Receive and transmit(drive to the transverter)connections are available on the transverter jack. Diddling with the regular 830 output jack, 6146's running, diddling with ALC voltages to drop the power all the way down to 10 watts or less to drive a transverter can be dangerous to the transverter. ALC voltage creepage, failure of your power reduction circuitry(whatever it is), having to dip and load to keep the 6146's in resonance, is the hard, hard way to do it. But whatever toots your horn.

Dear Fellow List Members...

I've been a member for about 3 weeks so if this information has been posted before or is generally known by the members of this list, then please excuse this posting.

A rather resourceful collection of reference pages about operating, maintaining and repairing the TS-830S has been assembled into a file (you get to choose either MS Word or PDF) for downloading at the following URL:

http://www.geocities.com/om6523/

The information may be helpful to those who already own and/or operate an 830 or to someone considering the acquisiton of one.

73,
Bruce
WC5CW

3044. TS-830 No Receive Audio Problem

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-12-18 16:08:18 UTC
From: Nazario C. Culanag Jr.
Topic: 3044 Message: 3044

Hi All,

I encountered recently a TS-830 without any receive audio and suspected the audio amplifier IC HA-1368R. Unfortunately, this is quite hard to find at present. What arrived instead when I ordered one is HA-1368 (without R). According to specs, this is a mirror of the HA-1368R. I installed it reverse (aluminium side is away from the heatsink so pin 1 of the audio ic is on pin 10 of the board) and put thermal grease on the platic side instead and it works. Just in case anyone encounter this problem, you know it has been tried and it works.

Topic: 3046 Message: 3046

hi,

The 1208 6m transverter has three connections on back,
6m ant, hf ant and transceiver.

The unit has pin diode rf switching so use is automatic
as long as unit is driven with 5 watts (stock unit).

There are no seperate input/output connections for transverter
in/out that you find on more expensive transverters.

It could be possible to modify the transverter for this use,
it is beyond the scope of the kits for these mods, we are on
our own.

I agree with Pete that it is easy to damage the transverter
if the drive power is too high.

The 'qrp circuit' in the files section uses a 9 volt battery,
lasts a long time.

From time to time, you can find the kenwood tv-502 2m and the
tv-506 6m transveters for sale, be sure to get the connection
cable to make using them easier.

Topic: 3026 Message: 3047

Hello group,

I'd like to use my old Hunter Bandit 2000C with the TS-820S, I don't have a manual on the rig so not sure if it can handle the switching current, the amp is very similar to a Heath SB-220 if most of you don't know what a Hunter 2000C is, runs a pair of 3-400Z (8163's)...any one know if the rig can switch it ok without burning up a relay, other wise Ill need the pin out on the accessory socket to find which one switches on the 12VDC on transmit and use that to switch a relay. The amp uses the typical gounding connection to key the internal relay in the amp.

Thanks in advance,

73, Tim
K8WBL

Hi Richard and the group,
A new week and a clear head. I was tired and making mistakes as we closed last week.
Please ignore my previous results.

I have pulses as follows:
IC7 Pins 8, 9, 11, 12, 14.
IC8 Pins 9, 11, 12, 14. Nothing on 8.
IC9 - IC11 Nothing.
Looks like IC8 is the culprit if it follows IC7 and leads IC9 in the chain.
Do you have the pinout for my IC TD3400AP? (7400?)
Should I look for a generic 7400? You mentioned that the pinouts may be different.

Cheers
Dave

new to hf ham for 35 years need advice on two items

I obtained the seperate V F O and tested all ok BUT there appears to be slight degredation on SSB signal quality when comparing inbuilt and seperate v f o s The best description is Slight warble or hum on seperate unit.

I also obtained 2 meter transverter The snag with this is that the SE model on inspection does not have the 12 way skt on rear. I have lead original Do I have any way off connecting OPTIONS? Regards best wishes from G8ACQ to all for the festive season all ideas appreciated BOB

Dave,

A group member kindly sent me an electronic copy of the Operating Manual for the TS820S. One thing I didn't know was that the original TS-820 (which I assume you have) requires the DG1A as an option to give a digital display whereas the later TS-820S has the internal digital frequency display fitted.

Now, I assumed that the DG1 that you have was a separate unit that connected into the rear of the transceiver (as does the DG-5, the subject of earlier e-mails). I believe that the TS-520 digital display is also external. However, reading the Op Manual it occurs to me that the DG1 may be an accessory that is fitted internally in your rig. Is this so?

The TS-820S display has two PCBs. The Counter Unit is part X54-1160-00 and the Counter Mix Unit is X54-1150-00. So it looks like the DG1 has the same PCBs (if it is a separate unit) that were later fitted as standard to the '820S. The Op Manual has schematics for these two PCBs although detail has been lost in the scanning.

So I have schematics which will be a great help. I will reply to your e-mails that I know are in my In-box this evening.

The original TS 820 was sold without a internal counter supplied but the DG-1 was a kit option that was made to be fitted inside the TS-820 making it a TS-820 S. Exactly the same as the counter assembly supplied in the TS 820 S.

Hi Dave,

You've been doing some good work over the weekend. The measurements that you made tally with the observations that you made in your original e-mail. I expected that the QA (pin 12) and QB (pin 9) bits were counting but not QC (pin 8) or QD (pin 11) - could you re-check IC8 pin 11? This is connected to IC9 pin 14 and, as well as being the QD bit, it is also the "carry" onto the next stage.

Based on your e-mail, it looks like IC8 may be faulty, although it is worth bearing in mind that the QC output may be being held fixed by a faulty IC13 (TD3075AP = 7475) (pin 6). Is IC8 pin 8 at 5V or 0V (or some other voltage)? If IC8 pin 11 is counting then a faulty IC13 is the most likely cause..

As you have noted, IC8 is type TD3490AP and I believe that this is the same as the generic 7490A.

Texas Instruments's web site says the 7490 is obsolete but it is available - I think that Fairchild and possibly other companies still makes it. There is also an LS version available which I believe would work just as well. I have found an LS version of both the 7490 and the 7475 from a distributor in the UK who will deal with individuals as well as companies. Big bucks - about equivalent of US$0.60 each, one-off quantities! If you have problems getting hold of these parts then I can get them for you. I will investigate other sources of the standard part.

If there is sufficient height available, then I would recommend putting in a socket for both IC8 and IC13 - preferably turned-pin types for reliability. Is the board through plated, or even single sided copper tracks? I recommend "Solderwick" for removing the solder - this will be very easy if the PCB is not through-plated - it may not be, being 20 year old.

The pin out for the 7400 (Quad 2-input NAND gate) is
Gate 1 - Inputs 1 & 2 output 3
Gate 2 - Inputs 4 & 5 output 6
Gate 3 - Inputs 13 & 12, output 11
Gate 4 - Inputs 10 & 9 output 8
Pin 14 is +5V and pin 7 is 0V

Thanks for the offer.

The schematics for the Counter Unit, part X54-1160-00 and the Counter Mix Unit, part X54-1150-00.

I think that we are getting to the bottom of the problem, but good schematics would be a great help.

Bob,
I also have a TS-520SE that I'm working on connecting to a TV-506, 6 meter transverter. You may want to look up my previous posts on this subject. This is a good news/bad news situation. The good news is that Kenwood used the same PC boards for the SE as they did for the S and plain vanilla 520, so the pin outs for the transverter connections are available. The bad news is you need to dive inside the radio and make some modifications to the wiring at the T/R relay and interrupt the wiring to other circuits to get all the other connections correct. You will also need to create several connections for the transverter, and drill or cut appropriate holes in the back of the cabinet. The OE style Hirose 12 pin connectors are as rare as hen's teeth, after months of searching I can't find a supplier. You may want to swap out for a more common molex type connector. Over all, good luck with your conversion. Please keep us up to date with your progress.

Dave,

I've just seen your later posting which answers one of my questions ref
activity (or lack of it) on IC8 pin 11.

The smart money is on IC8 being faulty. Do you have access to any suitable
suppliers/distributors of 7490A or possibly 74LS90?

Topic: 2974 Message: 3058

Thanks Richard.

4V hf pulses as follows:
IC7 pin8 50kHz pin11 50kHz pin14 500kHz
IC8 pin8 50kHz pin11 zero pin 14 50kHz
IC9 pin8 zero pin11 zero pin 14 zero

The IC holes look through plated.

Presumably, the low frequency squarish-waves are timing pulses and the high frequency are counter pulses.

Cheers
Dave

Dave,

IC7 looks OK (I don't know what the frequencies should be, but at least it is clocking). The input clock is pin 14 and so the frequency of the carry from pin 11 should be 1/10 of this, which it is. The input clock to IC8 pin 14 will, of course be 50kHz since it is fed from IC7. The 7490 is unusual in that it is a divide-by-2 followed by a divide-by-5. So the output of the divide-by-2 should be 25kHz (pin 12). This is connected to the input of the divide-by-5 (pin 1) and if the counter was working OK you should see activity on pins 9, 8 and 11 (QB, QC and QD), with pin 11 being at 5kHz. Did you mis-count on the pins of IC8 - I expect activity on pin 9 but not on pin 8 based on your original e-mail. I don't think it matters the most probable fault is IC8 with IC13 my second choice.

Richard

Dave,

I would expect to see +5V on pin 5 of IC7 to IC11. The 7490 is an odd-ball with +5 on pin 5 and 0V on pin 10. Incidentally, the 4-bit latches (e.g. IC13) have an odd-ball pin out as well, but not quite the same because they are 16 pin devices. +5V on pin 5 and 0V on pin 12. I think that these were early TTL designs before TI standardised on the corner pins for the supply.

I don't think there is any need to be concerned about the end of the part number. The P probably is the package type and the B is probably an update that went into the mask set at some point. All the info to hand, pin numbers on the circuit, etc, point to it being the same as the 7490.

I think the original part may be by Toshiba. Can you see any name or logo?

Have you ever removed ICs from plated through boards? I forgot to ask if you are involved in electronics professionally.

Richard

Hi John,

Gosh, where do I get started? Generally, when running an antenna with a transmatch, you want the antenna to be a 1/2 wavelength on the lowest frequency you intend to use it on. So in your case, it may be difficult to load up on 80 meters, though it should be ok on 20.

I assume you fed the antenna with a length of coax. If you fed it with a balanced line, such as 450-ohm ladderline, the transmatch would have a much easier time of obtaining a match, and you would have much less line loss. Your transmatch would have to have a balun in it (balanced output terminals).

A good ground is also important to any system.

The TS-520 needs to be tuned up into a dummy load before you try to load the antenna with the transmatch.

The other idea I had was that perhaps it seems you are not getting out on 20 very well because your dipole signal is being compared against other hams' signals, which seem to often be a beam or high-performance vertical.

That's my 2-cents. I hope it gives you some ideas to work with.

73,

Eric KA8FAN

Dear John,

Well, the simplest answer you already have... it is whether you are being heard elsewhere that is important, not what some meter says... For example, you can tune up into a 50 Ohm resistor and have 1:1 SWR... and NO radiation taking place. Generally, dipoles only work well on their design frequency (40 in your case) and at 3 times the design frequency... so it would work OK on 15, though the pattern will be more off the ends than broadside... If you look at the feed point impedance, a dipole in free space is about 73 Ohms...a fair match to the coax feeding it...but, when the elements are electrically longer (20 M) or shorter (80 M) then the feedpoint impedance is sky high... hard to get any power transfer between the feed line and the radiating elements... where does the power go? In the coax, and in the tuner... and since your SWR is good between transmitter and feedline, it is probably not being dissipated in the tubes... though I could be to some extent. Mostly it is in
circulating currents and the I squared R losses in the coil inside your tuner.... If it is big beefy tuner, then you probably are not key down long enough to notice it, and the components are tough enough not to arc over... but with more power... well... things can get hot... and arc..

The suggestion about using open wire line in another response is a good one... make yourself a G5RV multiband antenna... there are several designs available on the web, in the ARRL pubs, etc... In these, the unbalanced (300 Ohm or 450 Ohm) feedline becomes part of the radiator, and the thing works quite well on several bands... the comment about a good ground in this system is quite germane... For low power... 100 watts or so, a good 300 ohm tv twin-lead wire works well. Just do not let it touch anything on the way to the horizontal elements... That is what they make those "standoff insulator" things for...or you can opt for the commercially available (and not too expensive) 450 ohm "ladder line", with the same restrictions... don't let it touch the house or anything else on its way to the antenna elements. Or you could go with one of the "Windom" designs.. basically an end fed wire... several designs and reports for these in the literature as well..

If you want to stick to the coax feed, try a trap dipole... you can get them commercially for "all bands"... or make some of your own.. the traps just electrically isolate sections of the wire so that it looks like the right length... when going lower in frequency, the inductors in the traps add length...

The biggest factors to "getting out" or "working DX" are antenna height, and a good ground to work against... I have a G5RV type antenna which I can load on all bands (160-10) with no RF in the shack... And yes, I have made a couple of 160 meter contacts on it... not real efficient, but it does work... and mine is only up about 40 feet at the middle and slopes on the ends... but in sloping down, I get some vertical radiation off the ends... Using this antenna, and my trusty TS-830 barefoot, I worked DXCC during the first DX contest I had it up, two years ago.. Have worked Asia (Japan and Korea) on it on 40 CW as well as Africa... so, you do not absolutely have to have a HUGE array to get out...

As far as the "field strength meter" comment... you can get one from MFJ... but I wonder if the result would be worth the investment... another ham rig would work as well... or another ham in the same town with an S meter to tell you whether your signal is stronger or weaker after you make changes...(the other ham should have his shack fairly close to yours for this to work well...) or someone with a mobile rig to do the same thing...

One last comment before I sign off... one of my pet peeves... the SWR myth... Everyone seems fixated on having 1:1 SWR... that is great if easy to come by... if not easy, then you have to ask... what does it mean that I DON'T have 1:1... for example... if the SWR is a bodacious 3:1 (unheard of in this day of transistor finals which fry on 2:1)... you will lose only 25% of your transmitted power!!!!!!!! Consider...if you send 100 watts up the line, and 25 comes back as a reflected wave, but the rest radiates.... how much weaker is your signal at the receiving end... Well, let's see... if you lost half your reflected power, you would lose 3 dB, or about half an "S" unit.. if you lose only 25% of it, that is a fractional "S" unit, and you probably could not hear the difference in 99% of your QSOs... if you want to try it, just make a contact, and then reduce your output and check it out... again we get back to where the power goes when it comes back down the feedline... it gets
dissipated as heat somewhere... maybe in the tuner... but if you don't use one, it gets dissipated in the plates of your wonderful tube finals which will handle it just fine... the marginally designed transistors will fry with that much extra power to handle... that is why many "modern" rigs employ automatic shutdown if the SWR goes over 2:1.... I run high band verticals (1/4 wave) on 15 and 10, and Bobtail curtains on 40 and 20, and the G5RV everywhere I want... usually my SWRs run 1.5-1.8:1 and I just don't worry about it...

Hope this is helpful

John
Well, I haven't seen any for sale new but I'm sure that you can get one by asking on the flea markets. It can be very easily built as I'm sure that practically any year ARRL handbook will have plans on how to build one . These are very simple ....a small whip antenna, a rectifying circuit and a meter. All the field strength meter does is catch part of the antenna's radiated signal and rectifies it to the meter. Doesn't give finite measurements but helps you see how much power is going to the antenna rather than being absorbed by the coax/feedline and antenna matchbox. Also helps you 'dip' and tune the transmitter and matchbox for max. power to the antenna.

Dave,

I didn't think to suggest trying the finger test! The counters should all be the same temperature. Being original TTL, they are reasonably power hungry (but warm, not hot) and most of the developments since have been to get the power down and/or the speed up. There is a huge range of 74 series variants these days, many now based on CMOS technology.

Anyway, I think it is bite-the-bullet time. Do you think that you can find any 7490 or 74LS90, or would you like me to get hold of some? I suggest two or three (IC9 is suspect as well) and also several 7475 or 74LS75 latches, just in case.

Is there sufficient headroom and real estate around IC8/IC9 etc to put in a socket?

I have two antennas up now, a 40-meter dipole which is coax-fed, has
a 1:1 balun. I also have a 160-foot random length antenna which is
mounted low to the ground (around the soffit of my building). Both
feed into an MFJ 949E antenna tuner.

Hi Richard,

Thanks again for your invaluable assistance in trouble-shooting this problem.

I live in rural south-west France but I shall visit my little component shop in Bergerac this afternoon and email my findings.
He may not stock anything digital. More like germanium diodes, accumulators and battery eliminators!
(or is that before your time?) If he hasn't got, I would accept your kind offer and reimburse your costs. I'll email mid pm.
Three 7490, three 7473 and three 14pin sockets. I have several 16pin sockets.
There is sufficient space for sockets.

Cheers
Dave

Dave,

If all else fails....

www.kenwoodparts.com ("East Coast" in NY) has counter boards in stock at
$137 according to a search I made just now. Also the counter mixer boards
at $190. This looks like a useful source of Kenwood parts.

Any group members used this company?

Battery eliminators are definitely not before my time! I've held my call
since 1961...

Feed line loss multiplies as the SWR increases. The SWR at the feed point of a 40-meter dipole on 80 or 20 meters will be very high. The higher the loss of your feed line, the higher the multiplied loss will be. Also the longer the feed line is the higher the multiplied loss. Properly installed balanced line will have lower loss when matched than just about anything else so it will have lower multiplied loss when not matched. There will be some loss but it will be far less than with coax.

In order to use coax you could parallel a 20-meter dipole to the same feed point as your 40-meter dipole keeping the 20-meter wires some distance from the 40-meter wires particularly near the ends. The resonant antenna wires will take the power on the band it is cut for because it's impedance will be around 50 ohms and the other dipole (s) will exhibit a very high complex impedance in comparison.

On 80 meters you also have problems. First the radiation efficiency of a 40-meter antenna on 80 will be less because it is less than ½ wave and it's radiation resistance will be lower. Line loss will be high due to SWR on the coax line, and tuner loss may be high as this may present a low complex impedance with capacitive reactance.

Again a good solution would be to parallel an 80-meter dipole to the feed point. If you don't have enough room, the ends can be folded down and even bent around like a Z.

These wires will affect one another slightly due to proximity. You will have to play around with the lengths of these dipoles to bring them into resonance. I usually end up with them too short so I add a piece of wire at the ends just inside the end insulator and let it hang down 12 inches or so at first. (6" on 40 and 4" on 20) #14 or 12 solid electrical wire works good. Then you can conveniently snip it bits at a time till it come in. If you snip too much off, you can replace the end wire and try again. Keep both ends equal length. Go from band to band and bring them in a bit at a time until they all fall into place.

On 80 you will change the length 2 or 3 inches at a time. On 40 1 to ½ inch at a time, on 20 ½ to ¼ inch at a time.

I have found the "fan dipole" consisting of several dipoles for different bands in parallel to be the most efficient multi band dipole. It has fewer compromises.

Subject: [TS-520_820_530_830] How can you tell if the antenna is loading?

How can you tell if the antenna is loading? I have an MFJ
transmatch, so I can set the antenna for low SWR. But how do I know
how much power is getting to the antenna?

I have a tuned 40-meter dipole, and I can get out on 40 meters OK,
but even with the antenna tuner showing very little SWR I'm not
getting out very well on 80 or 20 meters.

I have a TS-520.

Hi Richard,

The shop owner's wife rummaged in her boxes of new fangled bits and came up
with the following which I bought:
3off MOTOROLA? SN74LS90N 14pin. Pinouts OK?
3off S? 74LS73 14 pin oops, should be 16pin. Must swap them for 16pin.

I'll get cracking with replacing IC8 with a socket.
Apart from using an angle grinder, are there any special requirements for
wicking and chip removal?
I've done some Veroboard work but nothing of this class.

Dave

Dave,

I am amazed that you were able to but 74LS90 locally. Also, did you really mean 74LS73 - this is a 14 pin device, a dual flip-flop.

The main problem with PTH boards is wicking up the solder that is within the holes. If the IC pins are a tight fit then this can be difficult, but hopefully you will not find a problem. I tend to wrap half a turn of "Solderwick" around the pin and heat it up and that tends to suck up the solder. Once I am reasonably sure the solder is out of the hole, I gently move the pin of the device with a pair of pliers so that it breaks away from the plated wall of the hole.

If you find problems then you can always cut each leg of the IC on the component side of the boards and then take out one pin at a time.

Richard

Hi, Dave. This will acknowledge receipt of your request that I send you the TS-820 service manual. I will put it in the mail ASAP. Sorry I didn't do it earlier, but the holiday season has been busy for me. Please put it to good use, and be sure to pass it on to someone deserving if and when you no longer need it. Gotta keep those TS-820's going! Good rig.

Say, Dave, I am Curious As the Devil about what you do for a living there in France. I love traveling to Europe, and am making another trip this June. As much as I would like to, I have never been able to figure out a way to make a living in Europe, or to stay there for more than just a short period of time, before having to return home to make more $. However, I am getting ready to retire now and am thinking of living in Europe when I do. Would you have any ideas about how one can live cheaply? Sure would appreciate any advice you can give me. Thanks, Dave. Bill Crowell, N6AYJ

Hi Bill (N6AYJ),

Thanks for your trouble. I'll certainly put the copy to good use on my lovely 820s.

My story in a nutshell:
We lived and worked in South Africa with an excellent, materialistic lifestyle but poor quality of life. Nice house, fancy cars, fast lane.
I did the sums and calculated that at 55, I could take early retirement and cash-in my pension at 18% tax. (that's another story)
We decided that we would rather be poor and happy in the French countryside with a lower standard of living but an excellent quality of life. Working without good French is very difficult We don't work.
We live off the earnings from our investment (5% interest at very low tax) + some capital.
We have enough for us to live until 90yrs old...
Loraine is 13 yrs younger than me so we have to have a 45 yr plan.
Ridiculously ambitious.
But what an adventure!
In France, we have a monthly budget of E1,500 + luxuries.
Inflation is really twice the official figure. Most things seem expensive but maybe that's a feature of living on fixed income.
The medical system is very good and you pay 8% of your salary for it if employed.
Don't do it unless you both agree up-front and you're both adventurous and can take some knocks in the golden years.
Do all your travelling before retirement. It's too expensive after!
I've never been happier. I'll be even more happy if the IC8 replacement fixes the problem!

Cheers
Dave

Dave,

Or maybe a bad IC8 might damage IC9. I don't think that is so because it
is an IC8 output connected to an IC9 input. However, IC9 has been
over-dissipating, and if OK now could give problems later.

I suggest just replace IC8 at present - after all, it will be in a socket
and easily changed.

Richard

When you say "getting out" what do you mean. That is a relative term. The bands have not been the greatest these days. That said, both of those antennas should "get out" Do they compete with a 6 element beam on a 100' tower? NOPE. Are you sure your radio is tuned well? I would imagine if the MFJ shows 100-ish watts forward, you should be OK. You might want to make sure your antennas are not touching anything that is grounding them out. How high is your building? I would imagine the soffit of a building would not be optimal but certainly good enough. With the 949e and some patience you should be able to tune and work 160-10 with varying degrees of success but success nonetheless.

I am off work from 24th through the 3rd and would be happy to listen for you. I have yet to ever work anyone from one these boards. Lemme know when and where (non-WARC) and I will give a listen and let you know how you are getting out.

Good Luck,

Sean - WA2LKV

Hi Richard and the group,

Success!
She displays like new.
Replaced IC8 with a socket and plugged in a new IC.
I cut the IC pins at the plastic and removed one line of stubs.(mistake!)
Removal of the solder in the through-plated holes proved to be impossible
with solder wick so I soldered in new pins then soldered the socket pins to
those.
I connected the input then scoped the pins and the following ICs. All OK.
The temperature difference I previously noted on IC9 is not detectable now.
Maybe it's just colder today...

Thanks to Bill for his guidance early in the problem, thanks to the other
Bill and Jason for their kind assistance, special thanks to Richard for his
expertise in matters logical and general thanks to the wonderful people in
this group.
I hope I can help someone in the future.
73s
Dave

Dave,

Congratulations! That is the best news I had this week! Wonderful news.

I hope we can meet over the air sometime.

Best 73s

Richard G3OTK

I know this is not a Kenwood Twins group but thought I would take a chance on asking if anyone knows where I can get a part for old T-599. The 16pin connector on the back that goes to the interconnecting cable set is broken pretty badly and it needs to be replaced. If anyone knows where to get one I would be very appreciative. If you have an old T-599 that you use for parts you would have what I need. Or if you know of someone who does that would be helpful. Kenwood does not have this part any longer to no ones surprise. I also need the collar that goes behind the main tuning dial as well.

I am trying to bring this unit back to life.

Thanks Steve NU0P

Hi all
Need an if board for ts 820s,the one I have has been fixed one to many times with a very hot soldering gun.(not me)
So if you or someone you may know who has one let me know.
Live in maine in the u.s and and will pay for shipping and time.
thank you and HAPPY HOLIDAYS!!!!!!!!!

Dave,

Thanks for the offer and I look forward to meeting you and toasting our success with fixing the TS-820 display. Probably in the UK because I am the only Brit who has never been to France!

Weekdays I am near Winchester/Southampton and weekends near Honiton in Devon. My radio operation is at weekends only, as G3OTK/P (from a gliding club airfield - a very quiet radio location), and I can put out some sort of signal on all HF bands. 80m or 40m would be probably be best. Good luck with the licence exam.

A very Merry Christmas to you and your family and all the best for 2005.

Also a Merry Christmas to other Group Members, particularly those who have monitored this thread to the very end.

Richard

Bob,
I haven't gotten that far yet with the mod. I've been too busy playing with the radio to play in the radio. As it is my only HF rig I haven't wanted to create a lot of down time for it. I also need to undo an 11 meter mod a previous owner installed before I can use the transverter. (Does anybody have the four 10 meter crystals?)

What I have done is compare the 520S schematics with those for the 520SE and the boards are exactly the same. Then I opened the case and visually verified that the various solder connections, etc. on the boards were actually present, and they are. The xvtr, gound and high voltage (there are 2) lines are straight forward and can be run directly out to their connectors. It gets a little complicated with the T/R switching and the T/R relay as well as the xvtr in/out slide switch. The wiring looks straight forward but I haven't physically traced those lines yet. This is where we will need to make the "breaks" I referred to in my earlier post.

I would have thought that sometime in the past someone would have made this mod, but none of the groups I have posted to are aware of it being done. It's not proven, but all we would be doing is reversing the mod Kenwood made when they went from the "S" to the "SE".

As soon as I figure it all out and get it done and working I intend to post the results to this group.

73 for Christmas and New Year.

3099. Re: [TS-520_820_530_830] How can you tell if the antenna is loading?

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-12-23 02:08:52 UTC
From: Eric Webner
Topic: 3064 Message: 3099

Well done Walt!

And may I add a couple comments:

The maximum number of dipoles that one can parallel is 4. Beyond that, there is too much interaction. However, a five-band dipole (fan) antenna can be had by installing 80, 40, 20, and 10-meter dipoles in parallel. 15-meter operation is accomplished through the 40-meter element (resonant on 3x its frequency). If space is a problem for the 80-meter antenna, I'd suggest a Van Gorden Engineering Shortened 80 meter dipole kit. Using a couple 23 uH coils, the overall length is only 90 feet. Using information from the ARRL Antenna Book, I reworked it to only 80 feet.

This was my first antenna 25 years ago, and it worked great. I coax-fed mine directly with the TS-520 and let its pi-net be my tuner. Its not a full-range tuner, but I could load up all five bands to full power. I could even work a large chunk of 80. Certainly, the SWR rose up as I got away from resonance, but the SYSTEM was able to transfer maximum power.

Referring to another response to this question, the writer indicated that one of his pet peeves had to do with antennas and swr, etc. I would direct all who are interested in the subject to look for a series of articles by M. Walter Maxwell that were published in QST back in the '70s.

I hope this helps you, Sean.

Eric KA8FAN

Walt Breining <n9wb@...> wrote:
Feed line loss multiplies as the SWR increases. The SWR at the feed point of a 40-meter dipole on 80 or 20 meters will be very high. The higher the loss of your feed line, the higher the multiplied loss will be. Also the longer the feed line is the higher the multiplied loss. Properly installed balanced line will have lower loss when matched than just about anything else so it will have lower multiplied loss when not matched. There will be some loss but it will be far less than with coax.

In order to use coax you could parallel a 20-meter dipole to the same feed point as your 40-meter dipole keeping the 20-meter wires some distance from the 40-meter wires particularly near the ends. The resonant antenna wires will take the power on the band it is cut for because it's impedance will be around 50 ohms and the other dipole (s) will exhibit a very high complex impedance in comparison.

On 80 meters you also have problems. First the radiation efficiency of a 40-meter antenna on 80 will be less because it is less than ? wave and it's radiation resistance will be lower. Line loss will be high due to SWR on the coax line, and tuner loss may be high as this may present a low complex impedance with capacitive reactance.

Again a good solution would be to parallel an 80-meter dipole to the feed point. If you don't have enough room, the ends can be folded down and even bent around like a Z.

These wires will affect one another slightly due to proximity. You will have to play around with the lengths of these dipoles to bring them into resonance. I usually end up with them too short so I add a piece of wire at the ends just inside the end insulator and let it hang down 12 inches or so at first. (6" on 40 and 4" on 20) #14 or 12 solid electrical wire works good. Then you can conveniently snip it bits at a time till it come in. If you snip too much off, you can replace the end wire and try again. Keep both ends equal length. Go from band to band and bring them in a bit at a time until they all fall into place.

On 80 you will change the length 2 or 3 inches at a time. On 40 1 to ? inch at a time, on 20 ? to ? inch at a time.

I have found the "fan dipole" consisting of several dipoles for different bands in parallel to be the most efficient multi band dipole. It has fewer compromises.

Subject: [TS-520_820_530_830] How can you tell if the antenna is loading?

How can you tell if the antenna is loading? I have an MFJ
transmatch, so I can set the antenna for low SWR. But how do I know
how much power is getting to the antenna?

I have a tuned 40-meter dipole, and I can get out on 40 meters OK,
but even with the antenna tuner showing very little SWR I'm not
getting out very well on 80 or 20 meters.

I have a TS-520.

Way to go!!!!

73,

Eric KA8FAN

Dave & Loraine <dave.crooks@...> wrote:
Hi Richard and the group,

Success!
She displays like new.
Replaced IC8 with a socket and plugged in a new IC.
I cut the IC pins at the plastic and removed one line of stubs.(mistake!)
Removal of the solder in the through-plated holes proved to be impossible
with solder wick so I soldered in new pins then soldered the socket pins to
those.
I connected the input then scoped the pins and the following ICs. All OK.
The temperature difference I previously noted on IC9 is not detectable now.
Maybe it's just colder today...

Thanks to Bill for his guidance early in the problem, thanks to the other
Bill and Jason for their kind assistance, special thanks to Richard for his
expertise in matters logical and general thanks to the wonderful people in
this group.
I hope I can help someone in the future.

Ah, good old intermittants; you will have fun
troubleshooting the low voltage supply first I
suppose.

Perhaps tapping around GENTLY, the insides of the rig
with the plastic handle of a medium sized screwdriver
will illuminate things for you.

Merry Christmas y'all

From: ka9inv
Topic: 2974 Message: 3105

Hello all... I haven't been here in awhile, and sorry for not having answered some of these posts!

Anyway, thanks to all the folks who answered... that website with mods for the display was helpful, although the suggestions didn't work. And I noticed something rather interesting about this problem I'm having - I turned the light out while my rig was on and my display was out, and I could actually see the display glowing a little! (I'm assuming a bad connection would not allow for such a thing to happen.) And I have a plug in the back of the rig with pins 8 and 9 shorted, so that isn't the problem... the display still occasionally comes on, but much more rarely now. I've cleaned the connectors, so that can't be it. I went through with my father and checked all the solder connections, and there doesn't seem to be a fault anywhere.

Does anybody have any clue what the problem might be? Maybe this info will help. Or, is it time to send her in to Kenwood and hope they can fix it?

Thank you all again, and Merry Christmas...

Sal KA9INV

From: ka9inv
Topic: 2974 Message: 3106

Oops, I forgot to add this little tidbit - if I tweak the RF gain or switch functions between VFO and a fixed mode and back, for example, this will occasionally bring the display back on.

Sometimes the display will also show the wrong frequency, BELOW the selected band. Again, switching the function nob to another mode and back will solve the problem a lot of the time.

Again, thank you all for your help...

Hi Sal,

If it's an 820s and tunes OK mechanically and it counts properly sometimes, it maybe the internal inter-board connectors.
Removal of the counter assy for cleaning the internal connectors is easy if you have 'skills'.

Unplug from the mains. Discharge the HT capacitors carefully!.
Tape the speaker lead and plug to a safe place where it won't be crushed.
Follow the book for removal of the counter.
Open the counter assy, remove the board screws and gently separate the boards.
Take care not to flex the boards when separating them with a plastic alignment tool.
Clean the inter-board connectors and also the soldered corners of the analog board.
Run the connectors in and out a few times before final cleaning (to remove any loosened debris) and assemble.
When refitting the assy, it's too easy to drop screws into the rig!

Good luck
Dave

The multi-vibrator transistors (Q10 and Q11), mentioned by Bill, are connected to a transformer which generates the HT for the display - there are two supplies generated for the display. One is a negative supply and I think the other is AC from the transformer. Unfortunately schematic that I have is difficult to make out in this area.

Topic: 3120 Message: 3120

I lost my recieve audio on my TS 530S
Smeter still moving
Picking up signals
Just no audio on speaker or headphones
Any ideas??

thanks

Merry Christmas

3121. Re: [TS-520_820_530_830] Need parts for T-599/A

It;s Digikey who carries Hirose now but the one I need which is
S-1316-SB(09). But it was a good try...Think I will have to go to the UK...

That is a tough one! I was in search of the elusive P-1316-CTA
plug, and I had a devil of a time finding one, at least in "eaches"
quantity. I finally found it at a place in the UK who were nice
enough to take a Visa Card and mail it to me. I don't know if they
have the matching socket but it is worth a try.

Sure.

Kenwood still sells em through PacCoastParts

www.pacparts.com

part number is

N35-4008-41

Make sure when you call them that you specify USPS
shipping or else it will be 9.40 for handling charges.

Mendelson Surplus in Dayton Ohio. You will have to go there though. Maybe you have a ham friend in Dayton.
Some day I should get a bunch of these when I am in Dayton and send them to Carrol. They are expensive though 10 cents/Lb US. I don't know if I can handle it!
Ace Hardware has metric screws, may not be exactly the same looking but will thread properly.
Uniden and Cobra base CB radios. 4 Big screws that hold the large black fold around cover.
Cobra 148 23 channel CB mobile.
XLR series Cobra C B's

Topic: 3135 Message: 3135

Hi all, my name is Jeff, KF3KWO. I had unsubscribed last year but I'm back now. I put up a 40m dipole and am interested in adding a few crystals to my TS-520SE so I can work DX split. Can anyone recommend which freqs I should get crystals for? I'm looking to get 4 crystals for 4 freqs in the range 7040-7100khz. I haven't been able to find any gentlemen's agreements for ITU Region 1 40m DX calling freqs.

Many thanks!

73 de Jeff

My opinion, but I would look for a VFO rather than 4 xtals. You will get more flexibility and if you ever sell the rig you can sell as a package or split the VFO and xcvr. Nobody will care if you have some extra rocks when you're selling the rig.

James,

This is usually bad finals. Get some known good tubes,
6146B matched pair preferred, and we will show you how
to fix it yourself if you have soldering iron.

You will have to follow directions carefully so YOU
don't get fried too.

bill

Jeff,

I would recommend against using fixed crystals for DX
split. Although there are dx "windows", there are no
actual "frequencies" where the DX hangs out; you will
always therefor be off of them with a crystal.

Instead, find a VFO-520. Save your pennies; it will be
about 150-200 with shipping but well worth it.

Better yet, find a used solid state rig with dual
VFO's ... everything from the TS-430 up will do
splits. If you really want contest-quality rig, go
with used TS-450 or TS-850. The 850 is going for 800
or less these days and is all the radio you will need
for DXing and contesting.

I would keep the 520 for ragchewing and for backup.

3141. Re: former subscriber returns to list

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-12-28 17:00:39 UTC
From: Jeff
Topic: 3135 Message: 3141

Bill,

Yeah, I figure it will be a one in a million chance that DX would choose a freq that I have a crystal for to call the US. VFO sounds like a plan. Thanks for the idea. Regarding getting a new rig, I'm not that much into contests right now, as the wife and kids are a contest enough :-0 And the 520SE works just fine, and it was free to me, so I'll use it until it blows up or melts.

Thanks and 73,

Jeff

Norm,

Thanks for the advice, sounds like a good idea. Wanted to go the
cheap route, but more flexibility will be well worth the money.

Thanks and 73,

Jeff

Hello All,
I have purchased a FL2100B for a very good price.
Would anyone know if there is anything Special or different I should know anout hooking a Kenwood to a Yaesu amplifier?

Larry Waisner,KD5VXK

3145. VFO-820 Use on a TS-830S

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-12-29 04:03:43 UTC
From: Michael Glennon
Topic: 3145 Message: 3145

Does any one know if the VFO-820 will interface with a TS-830? I have the service manual on the TS-830 but it only shows the VFO-230 and said VFO-240 will also connect. I have a VFO-820 and would like to interface it to my TS-830.

Will it interface?
If so is the cable a pin to pin cable from the TS-830 to the VFO-820?
Is there a place I can get a copy of the manual/schematic for the VFO-820?

3146. Web Beacons

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-12-29 15:19:30 UTC
From: Budd Turner
Topic: 3146 Message: 3146

For your information ...

Yahoo is now using something called "Web Beacons" to track Yahoo Group users around the net and see what you're doing and where you are going - similar to cookies. Yahoo is recording every website and every group you visit. Take a look at their updated privacy statement:

http://privacy.yahoo.com/privacy

About half-way down the page, in the section on cookies, you will see a link that says web beacons.
Click on the phrase web beacons.

http://privacy.yahoo.com/privacy/us/beacons/details.html

That will bring you to a paragraph entitled, "Outside the Yahoo Network." In this section you'll see a little, "click here to opt out" link that will let you "opt-out" of their new method of snooping.

Once you have clicked that link, you are exempted.

Notice the "Success" message on the top of the next page.
BE CAREFUL because on that page there is a "Cancel Opt-out" button that, if clicked, will *undo** the opt-out.

3147. Re: [TS-520_820_530_830] Re: Need parts for T-599/A

Steve,

I was about to send a reply to your earlier e-mail about the UK company
when I saw Jim's posting. Their web catalog is dated 2003 but hopefully
they still stock them.

The part number you quoted is an 8 pin chassis mount connector with socket
contacts but your original e-mail mentioned 16 pins. Do you need a chassis
mount or a cable mount? Both cable and chassis mount types are in their
catalog with both pin contacts and socket contacts.

Let me know if you would like me to check them out - may have to wait until
next week as most of UK shuts down until 4th Jan.

73s,

Richard G3OTK

Hello Michael,

unfortunately Kenwood changed the vfo frequenzyrange
from the TS520/TS820 to the TS530/TS830/TS120/TS130
series.So the 520 and 820 have 5 to 5.5 MHZ and the others
all have 5.5 to 6 MHz.What means you could use the vfo 120 or 240 or 230
or dfc 230 for your TS 830 and no others.I use here the vfo 120 and the
vfo 230 with the modification one turn on the knop only 6.25khz which
makes tuning very smooth.

all the best for you and yours and good luck for 2005

Kay DL5OAQ

7 pm eastern time, eh?

I am ready!

I use my Bencher paddle, right side, and set my 850 or
IC-703 to "paddle" mode. That gives me a sideswiper
straight key.

On up and down key I am limited to about 12 wpm; with
the Bencher paddle done sideways, I can run 20-25

3155. RE: [TS-520_820_530_830] VFO 520 Cable Parts

Yahoo group: TS-520_820_530_830 (2001 — 2004)

Hi Gary, Since I like to try to get by as cheaply as possible, I looked at Mendelson?s here in Dayton. The good news is I found some plugs that were designed to fit into a 9-pin miniature tube socket. The bad news is, since I needed two (one for each end of the cable), I bought the only three I found. It is a good thing I had an extra one because I ended up damaging one of them. It took me a long time of looking through dusty bins to find them so they might have more. More good news is that that they sold them to me for a quarter each. For the cable, I used some old modem cable that was lying around. Only one conductor requires shielding, but, of course, all the conductors in my cable were shielded. It seems to work fine. You might want to look around and see if you can find some kind of plug that was meant to fit into a 9-pin tube socket. I tried to think of a way I could use the bases of a couple of old tubes. But since such tubes are made entirely of glass, I gave up on that idea. But now that I think about it, if you could neatly cut the glass base from a 9-pin tube and remove the tube elements, you might be able to epoxy it inside the end of a piece of metal tubing after soldering the cable conductors to the pins. Or you could just spend a few bucks and order the plugs. 73, Glenn W8EXX --- On Thu 12/30, Gary Stebbins < stebbinsgr@... > wrote: From: Gary Stebbins [mailto: stebbinsgr@...] To: TS-520_820_530_830@yahoogroups.com Date: Thu, 30 Dec 2004 09:14:02 -0800 (PST) Subject: [TS-520_820_530_830] VFO 520 Cable Parts I am looking for a source for 9 pin plugs to build a cable for a Kenwood VFO-520.? I am looking for a source for 9-pin male miniature sockets.

I need to replace the connecting cable between the TS 830 and VFO-230. Any info or offers...?

Thanks,
Bill - W7WEL

Are you taking into the mike or whistling? SSB only has output when the
mike has some input.

At 06:00 PM 4/30/2005, you wrote:
